**Carotid artery and stenting:
from geometrical analysis to computational
hemodynamics**

Giovanni Maria Formato

Tutor
Michele Conti

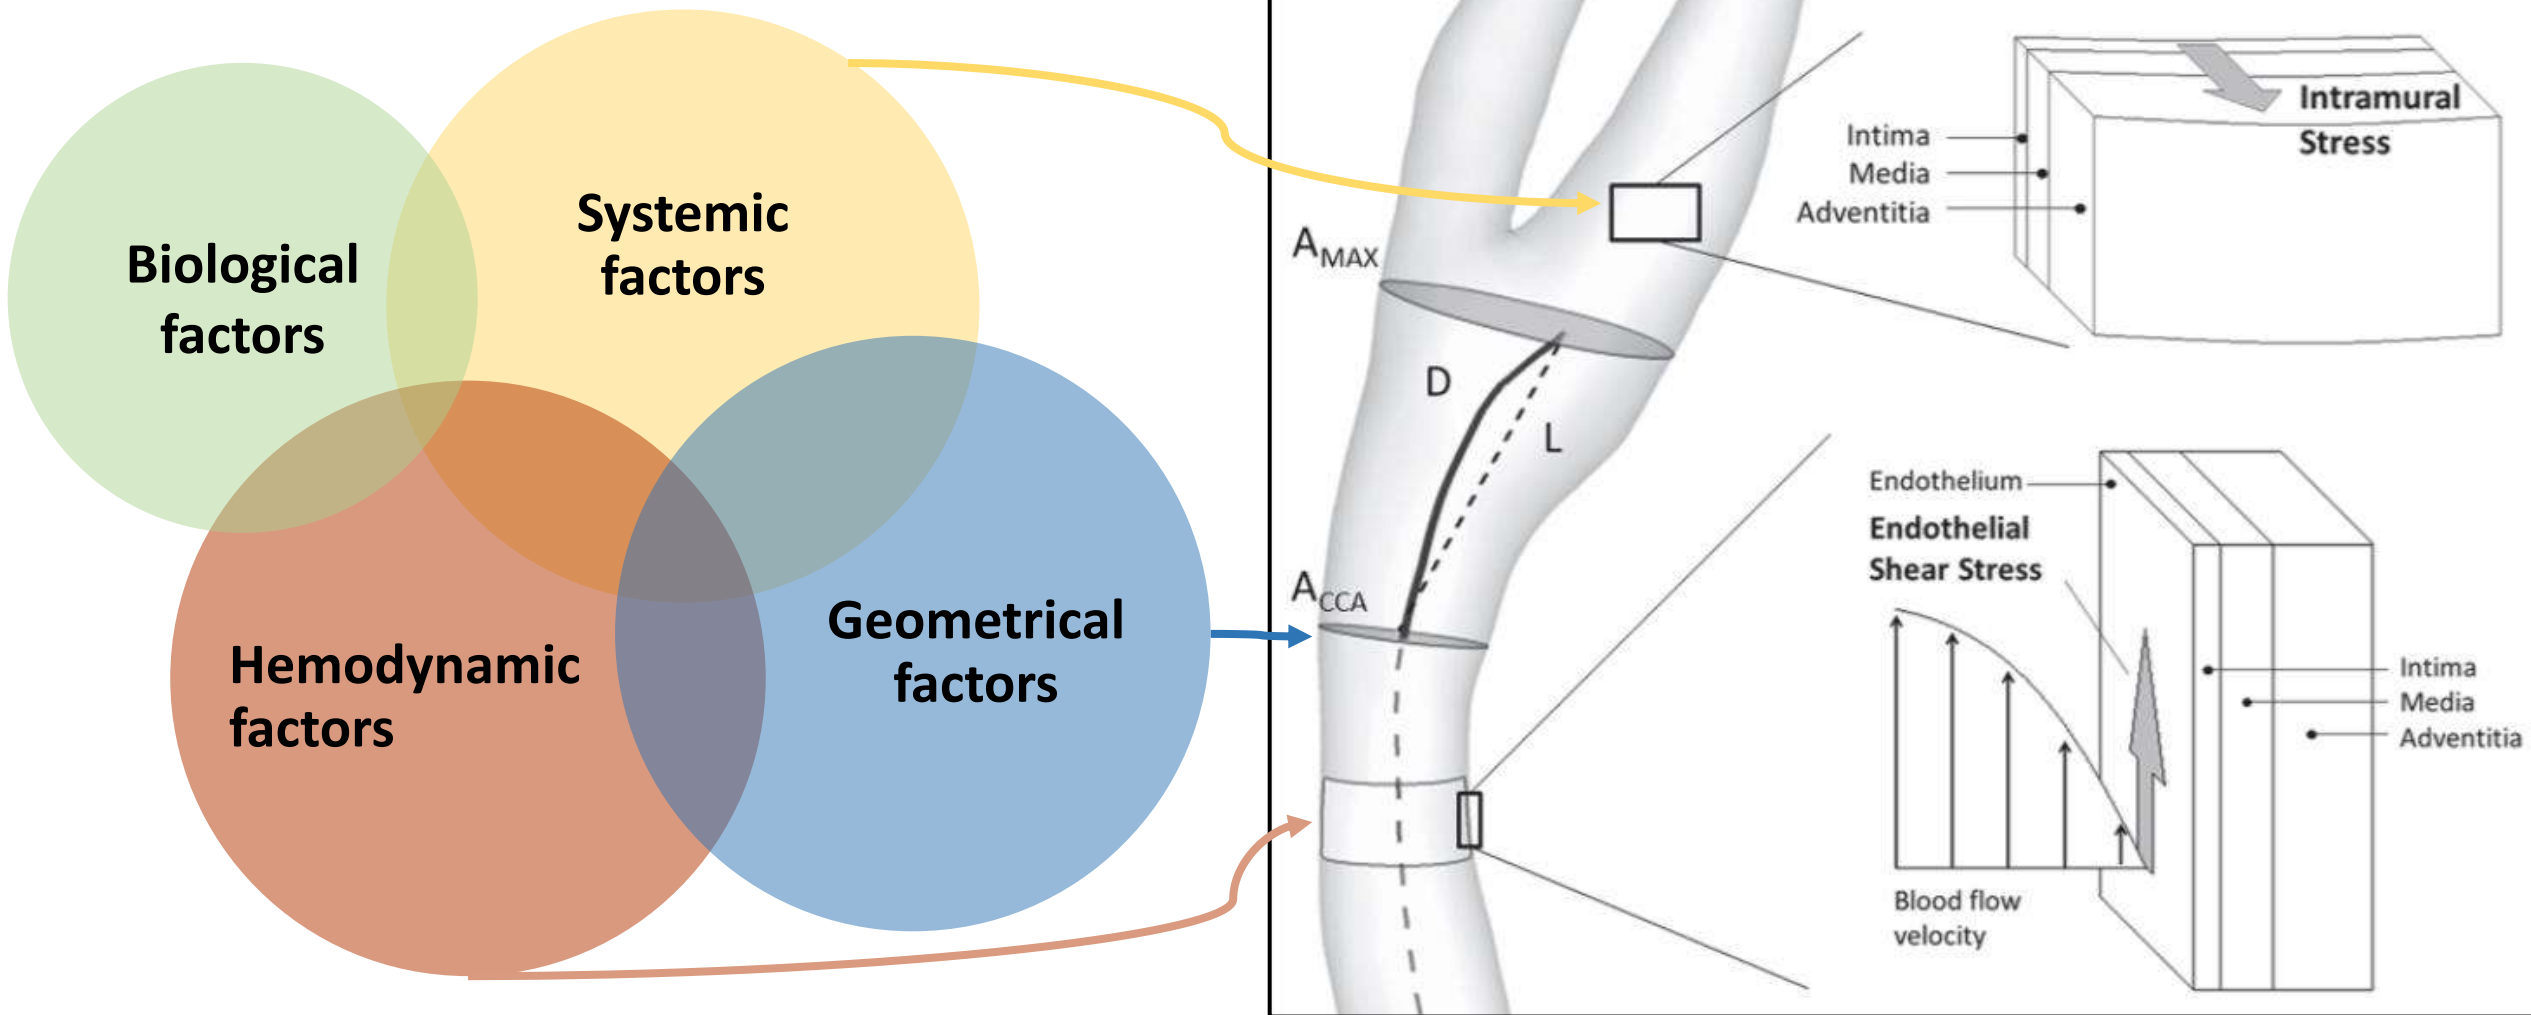

Pavia, 23/02/2021

AIM OF THE THESIS

- I. Set-up innovative computational tools for **geometrical** and **hemodynamic** analysis in the carotid artery
- II. Apply the developed tools in different clinical perspectives of **arteriosclerosis**

MULTIFACTORIALITY OF ARTERIOSCLEROSIS

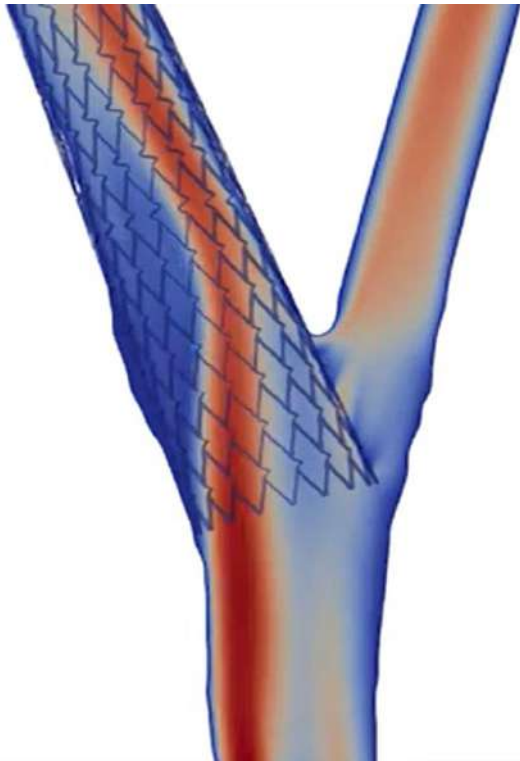

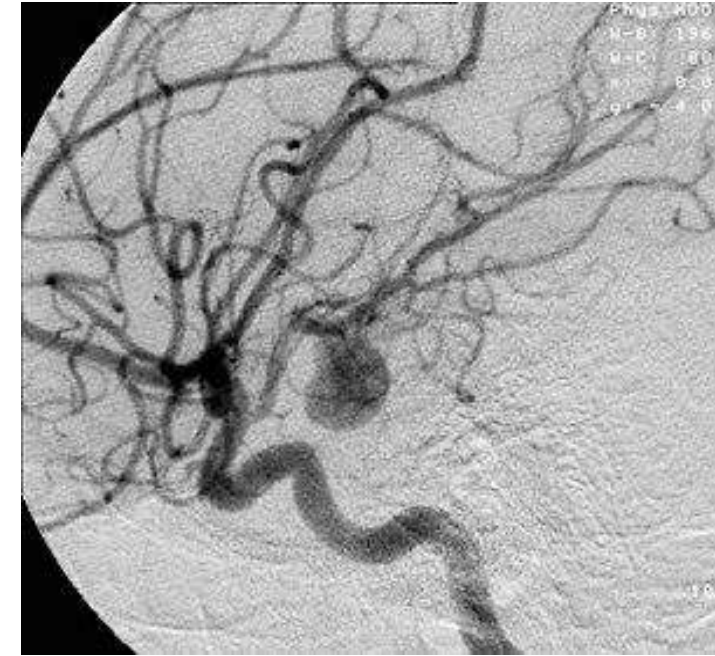

Susic et al. 1997
Han et al. 2012

Morbiducci et al. 2016

THESIS OUTLINE

I. Arterial morphometry, cerebral perfusion and hypertension

- **Method:** Framework for automatic splitting and morphometric analysis of carotid and vertebral arteries
- **Application:** Analysis of vascular morphometry and blood flow in a multipatient dataset of 112 normotensive/hypertensives

II. Carotid stenting, hemodynamics and restenosis

- **Method:** Framework for analysis of post-stenting carotid hemodynamics exploiting the immersed approach
- **Application:** Proof-of-concept study assessing the impact of 4 stent designs on carotid hemodynamics

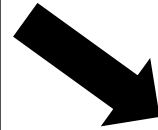

Arterial morphometry, cerebral perfusion and hypertension

BACKGROUND AND AIM OF THE STUDY

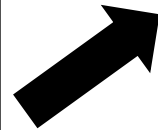

- Cushing mechanism: insufficient cerebral flow & hypertension (*Paton et al. 2009*)
- Prevalence in hypertensives of congenital variants of vertebral arteries (*Warnert et al. 2016*)
- Insufficient data concerning carotid arteries (*Pancera et al. 2000*)

Study on a population of **112 participants** if hypertensives exhibit specific morphometric features of carotid and vertebral vessels

Framework to automatically:
→ Split vessels
→ Extract morphometric features of local tracts

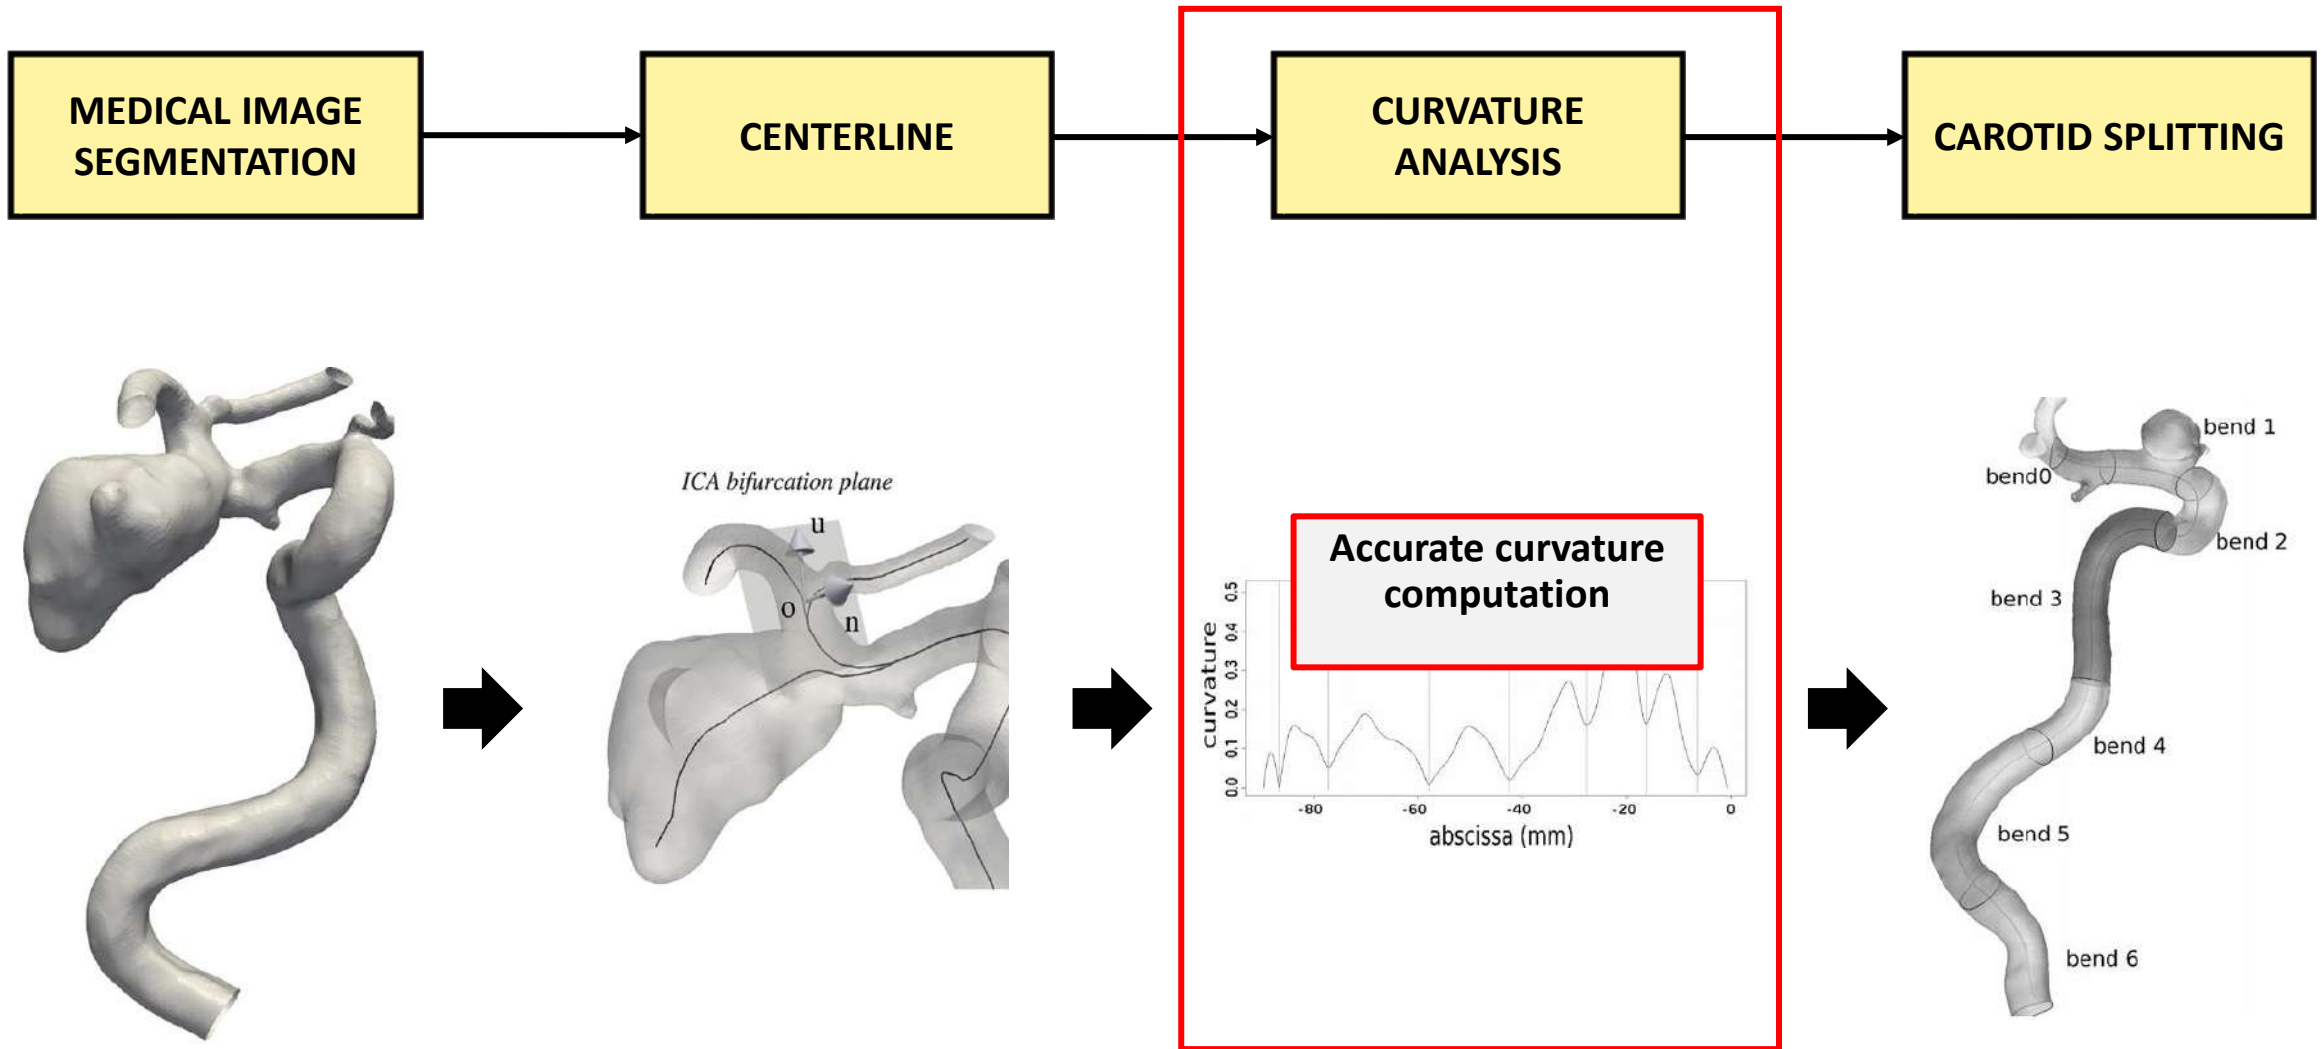

- **Global measures**
- **Manual measures**

Tortuosity
1.1

Tortuosity

FRAMEWORK FOR VASCULAR SPLITTING

Piccinelli et al. 2011

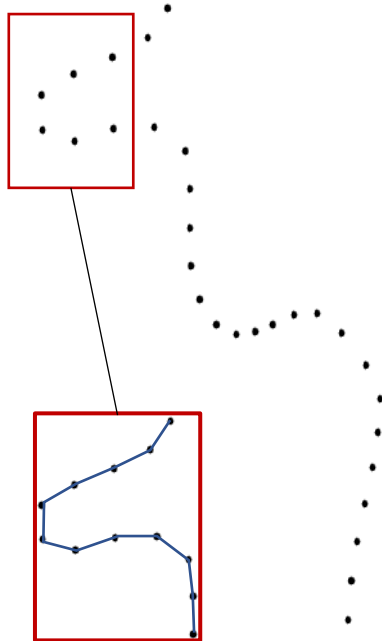

CURVATURE COMPUTATION BY CENTRAL DIFFERENCE

STL 3D MODEL

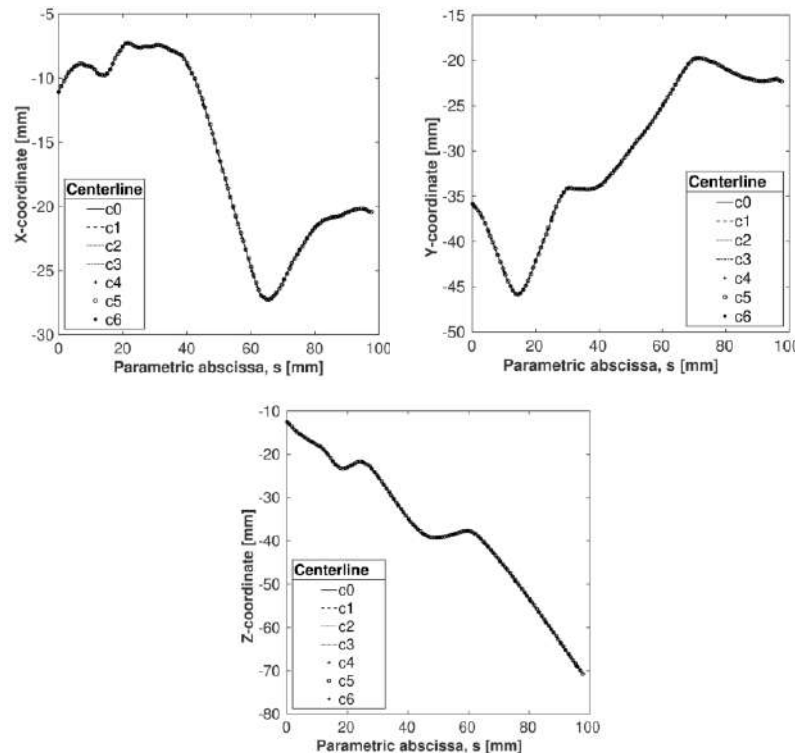

CENTERLINE

Resampling=1 mm
(≈100 points)

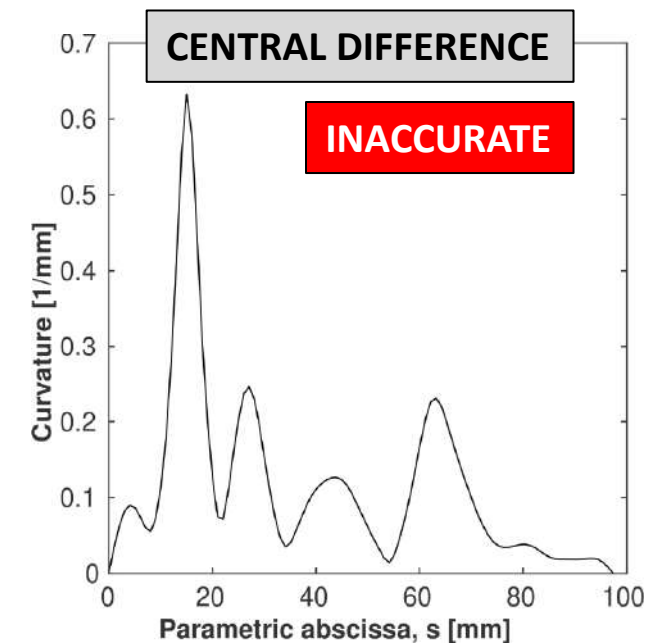

CENTERLINE COMPONENTS

$$c(s) = (x(s), y(s), z(s))$$

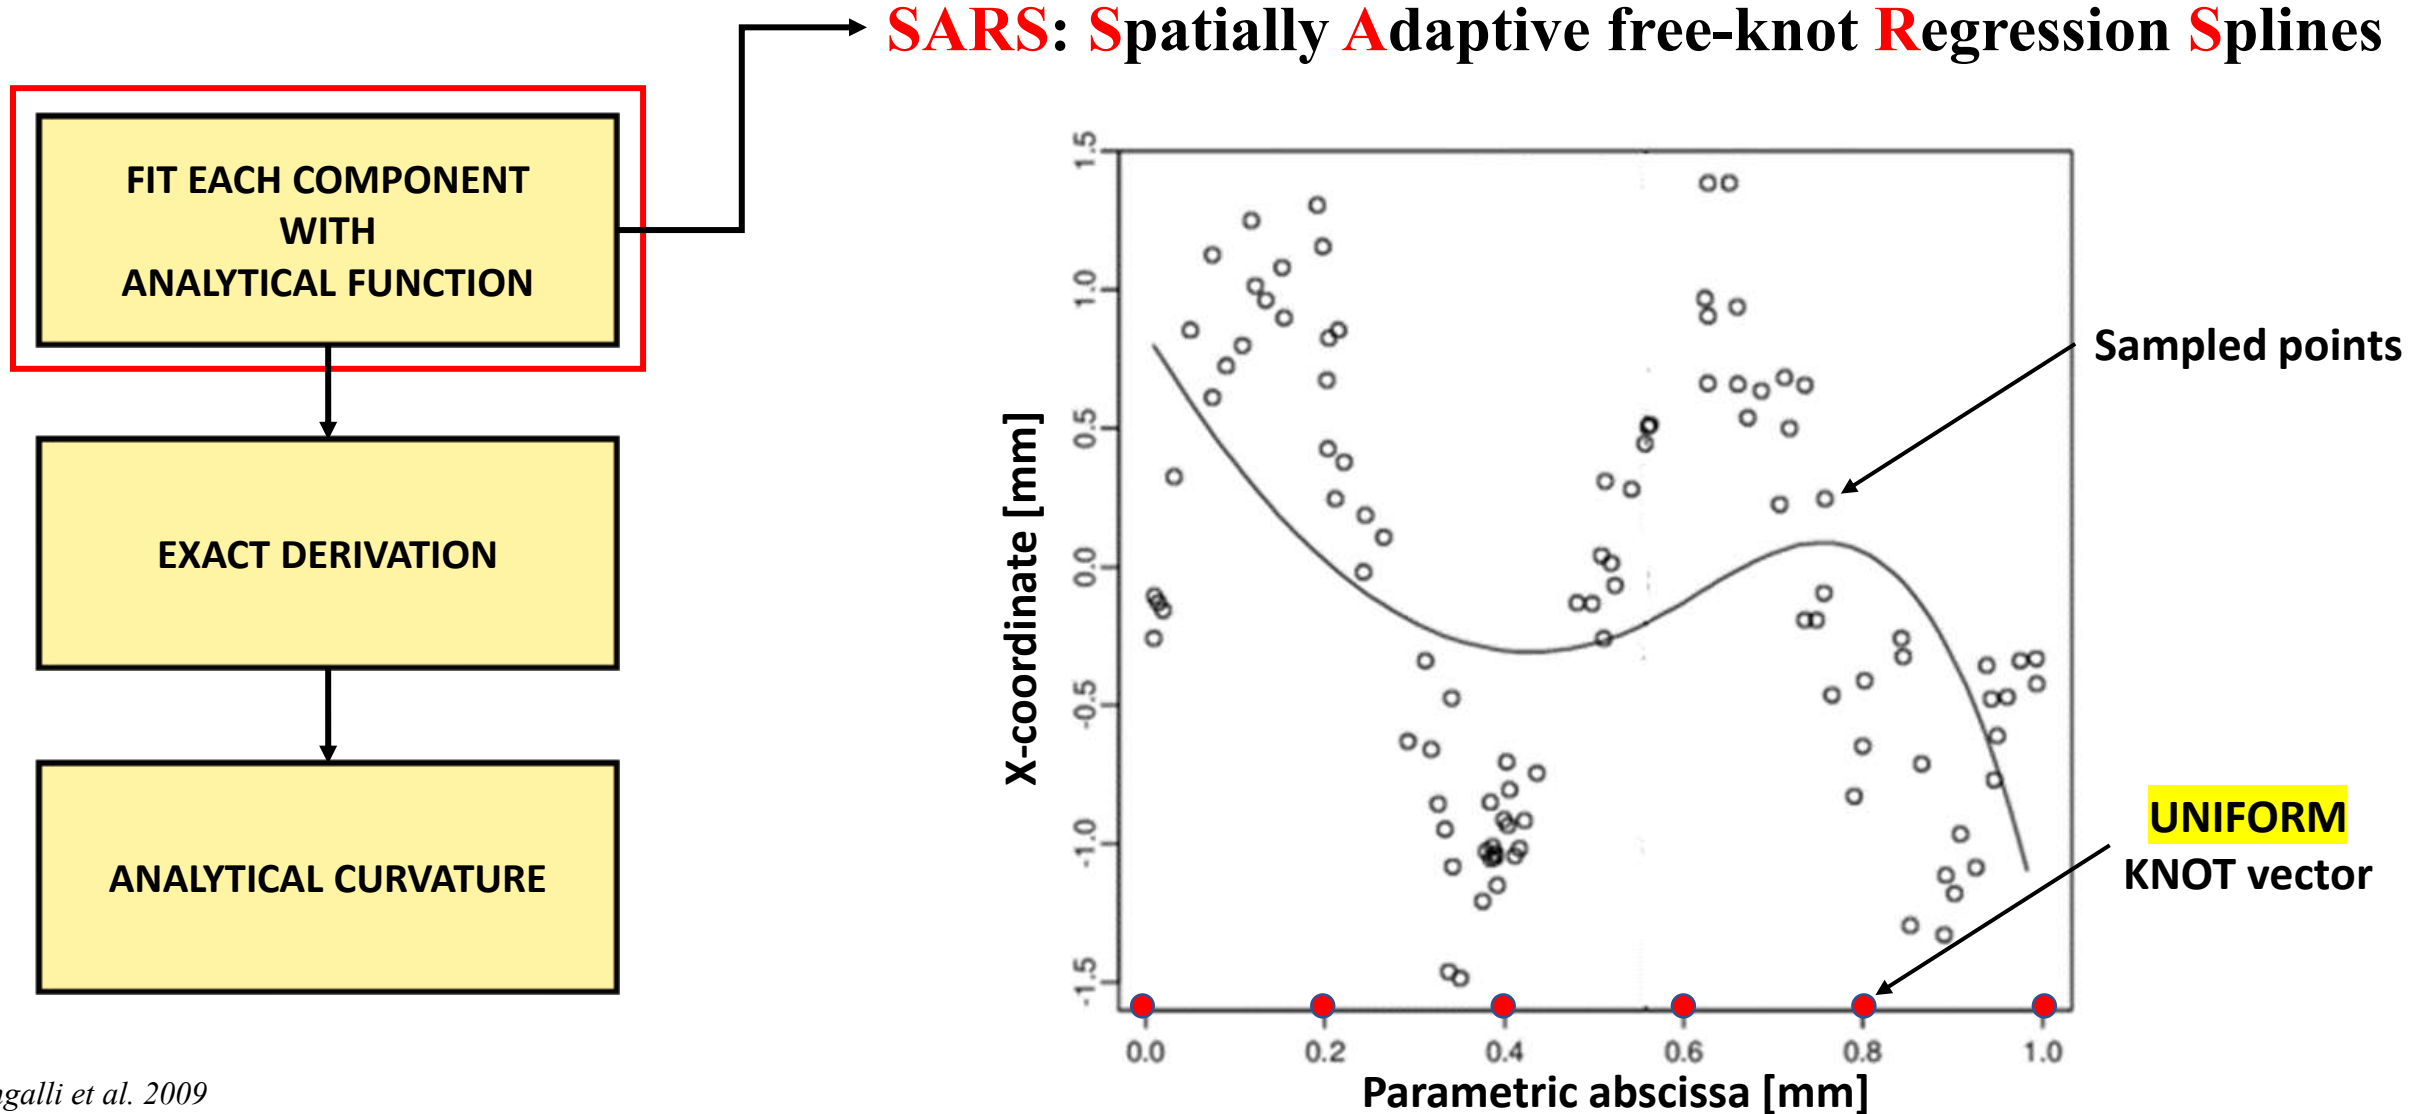

CURVATURE

$$curv_c(s) = \frac{\|c'(s) \times c''(s)\|}{\|c'(s)\|^3}$$

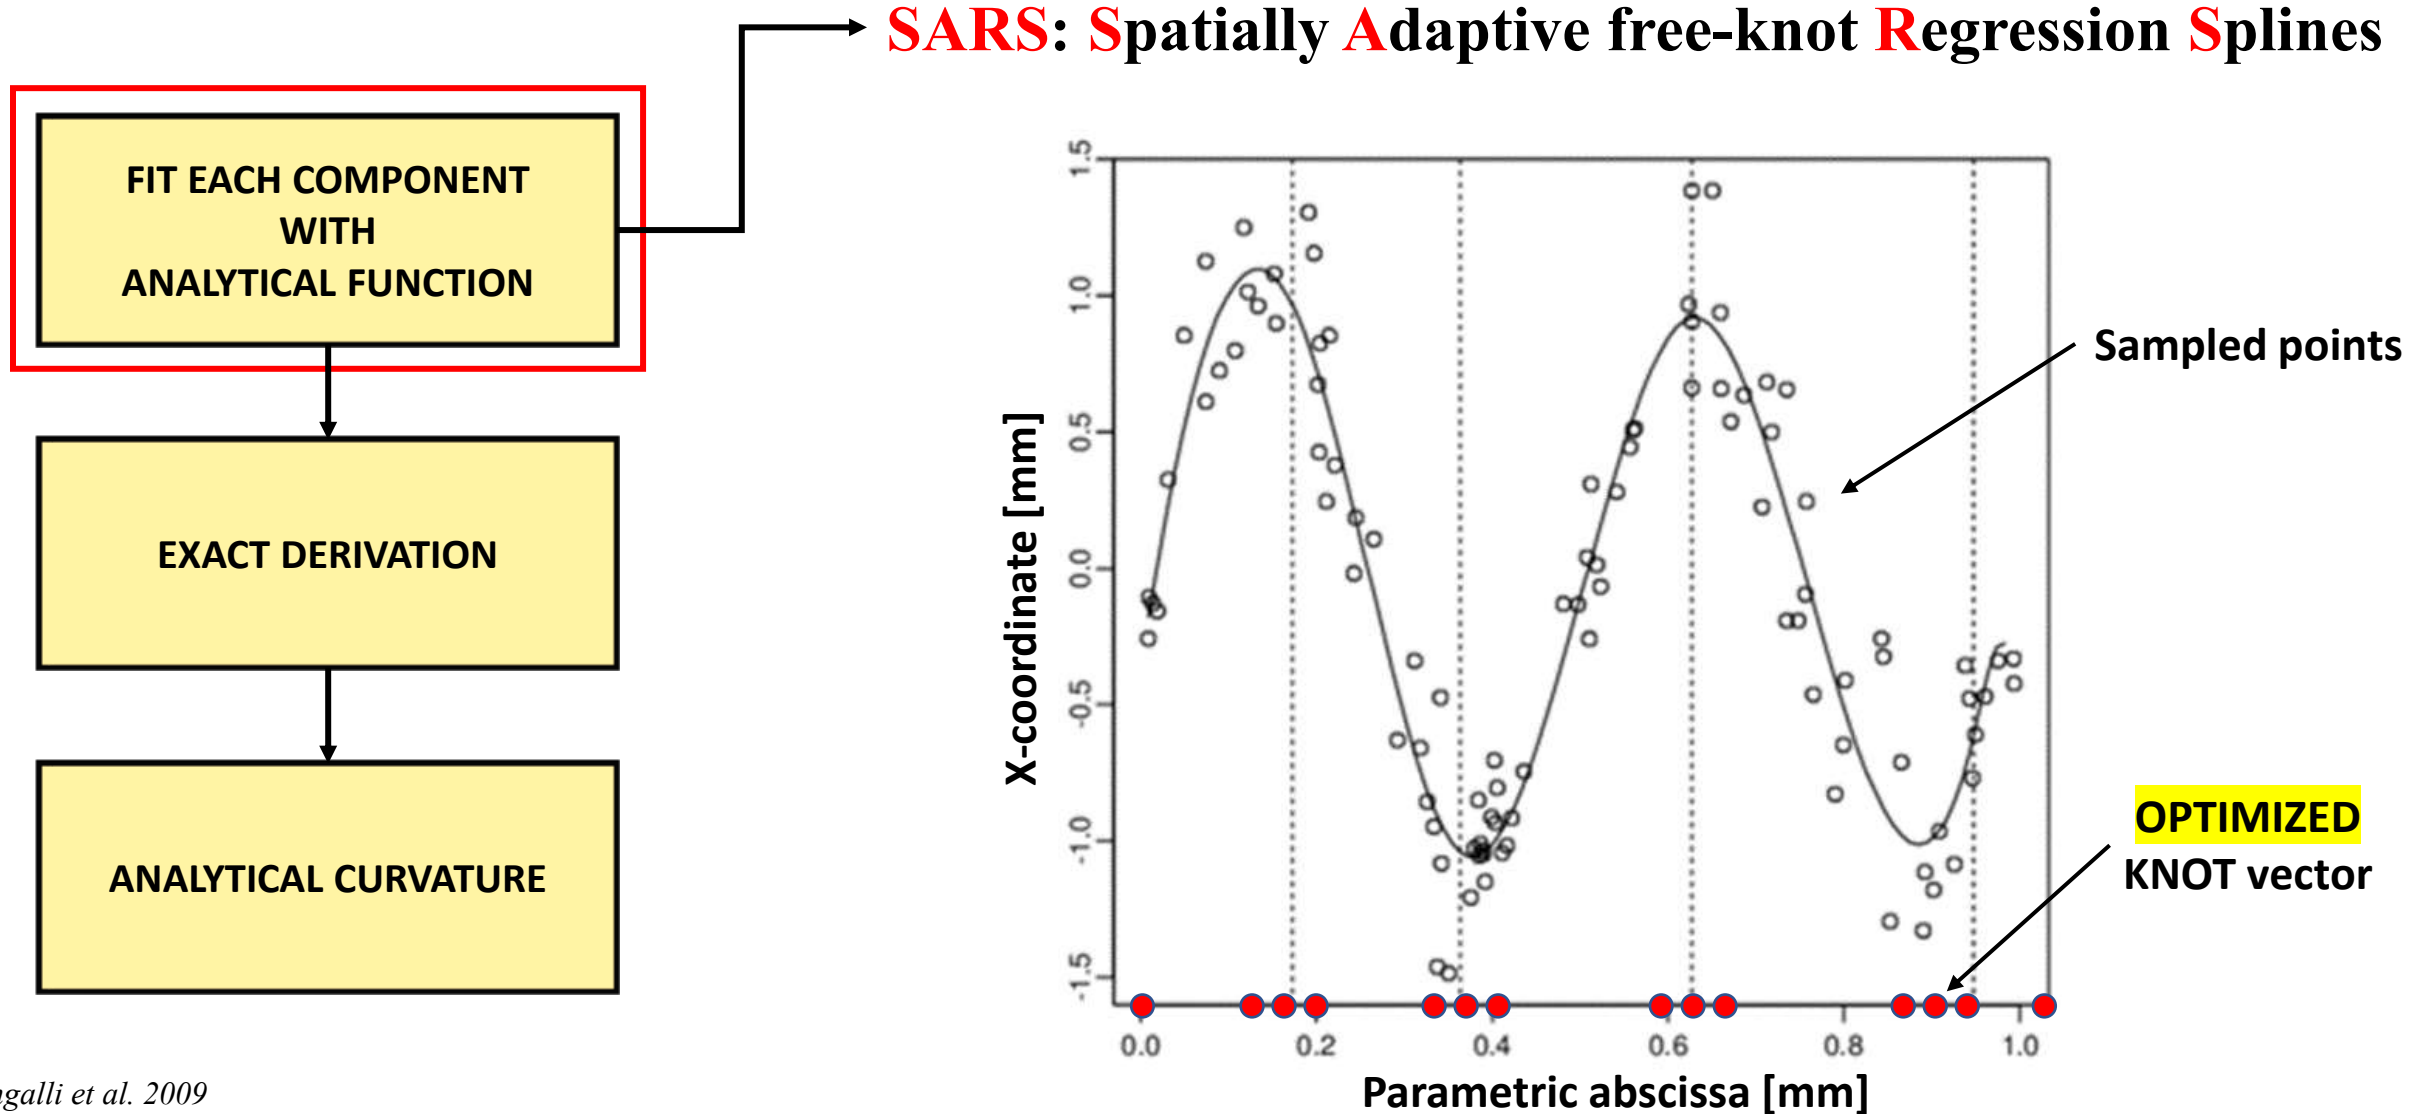

SPATIALLY ADAPTIVE FREE KNOT REGRESSION SPLINES

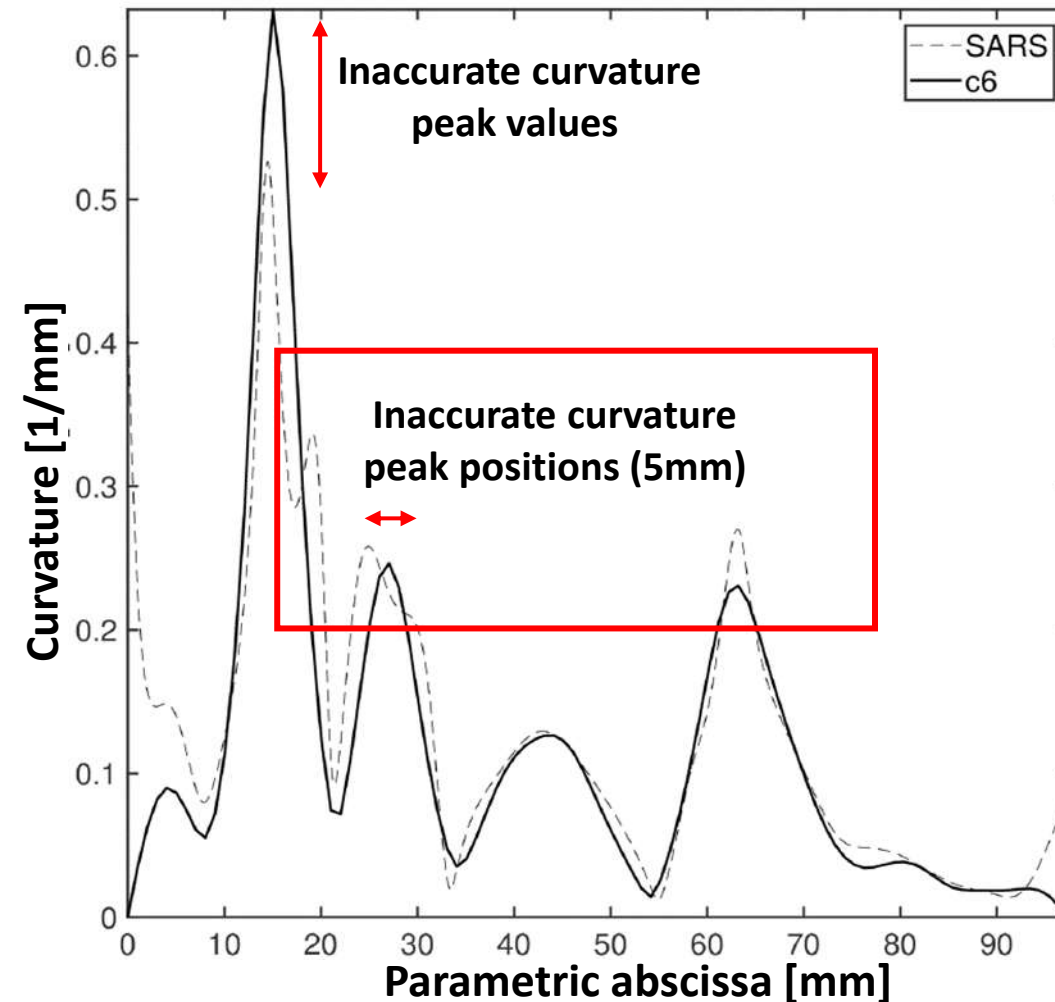

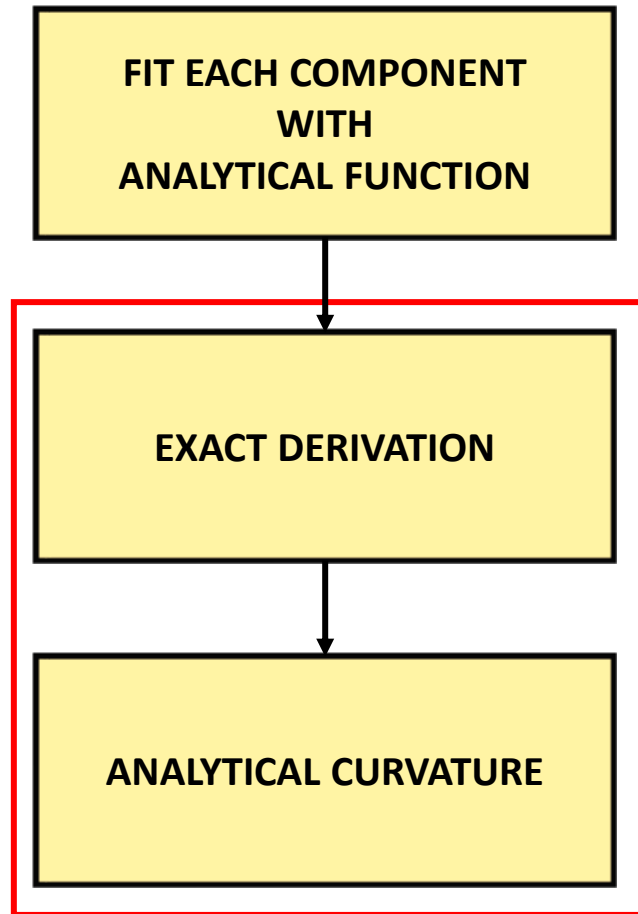

Sangalli et al. 2009
Zhou and Shen 2001

SPATIALLY ADAPTIVE FREE KNOT REGRESSION SPLINES

CAROTID SPLITTING

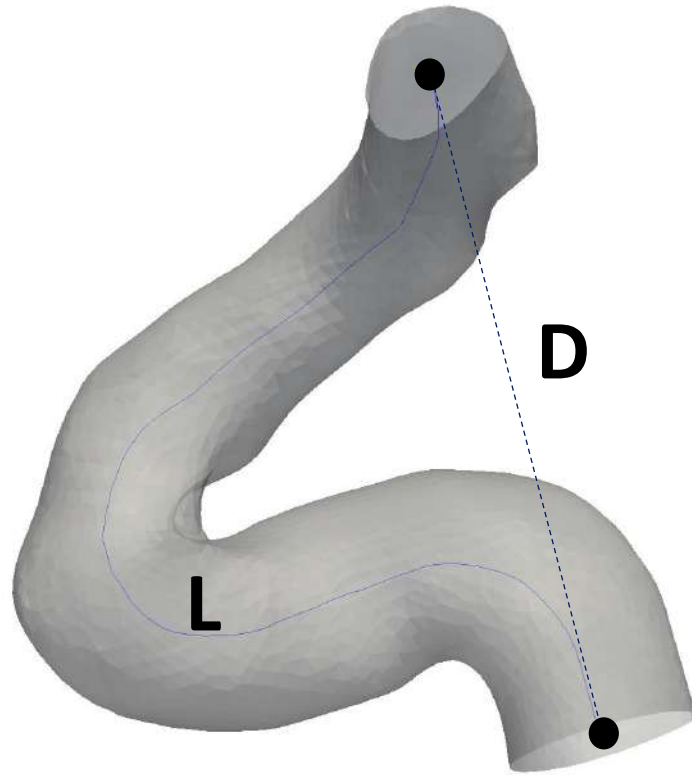

VERTEBRAL SPLITTING

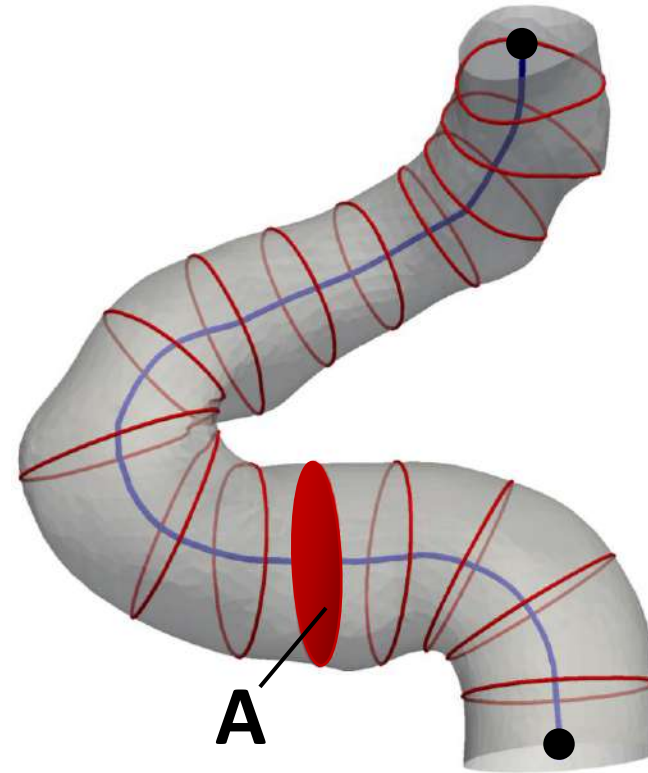

AUTOMATIC MORPHOMETRIC MEASUREMENTS

SPLITTING

$\text{Tortuosity} = L/D$

Caliber

MORPHOMETRIC
DATA

MORPHOMETRIC ANALYSIS: MULTI-PATIENT STUDY

PATIENT DATA

Participants

- 41 Normotensives
- 71 Hypertensives

Dataset

- Blood pressure
- Anatomic data from 3D TOF MR
- Flow data from PC-MR

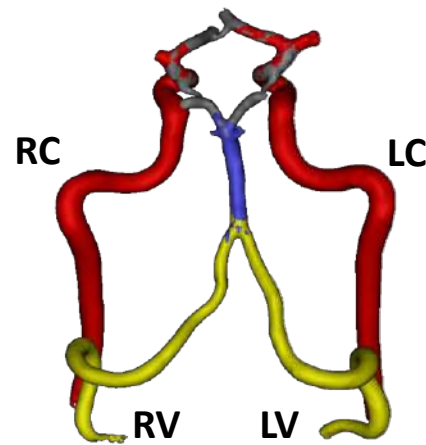

MRI SEGMENTATION & CENTERLINE EXTRACTION

Vessels

- Right/left carotids (RC/LC)
- Right/left vertebrals (RV/LV)

Segmentation MIMICS

Centerline extraction VMTK

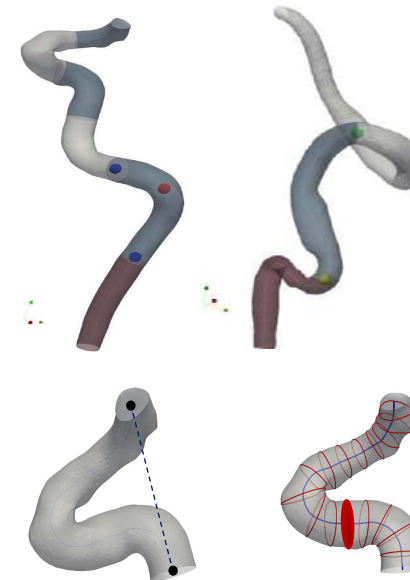

VASCULAR SPLITTING & MORPHOMETRIC MEASUREMENT

Splitting

- 112/112 RC and LC
- 98/106 RV
- 101/106 LV

Measuring

Tortuosity, length and caliber

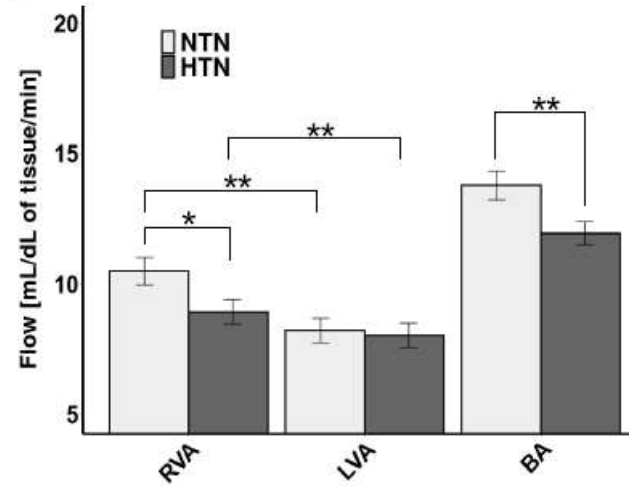

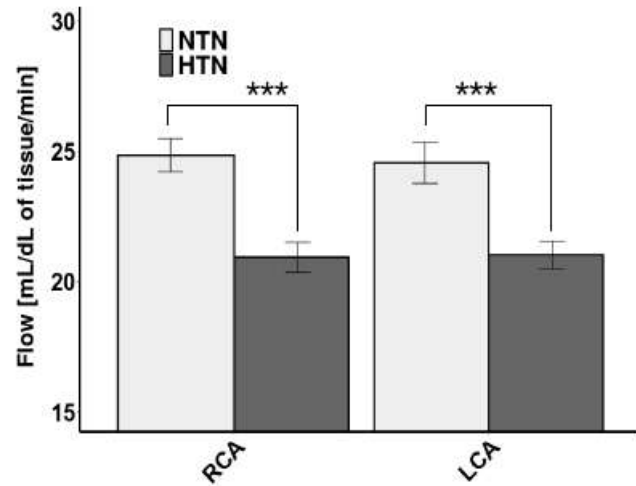

STATISTICAL ANALYSIS

Statistics:

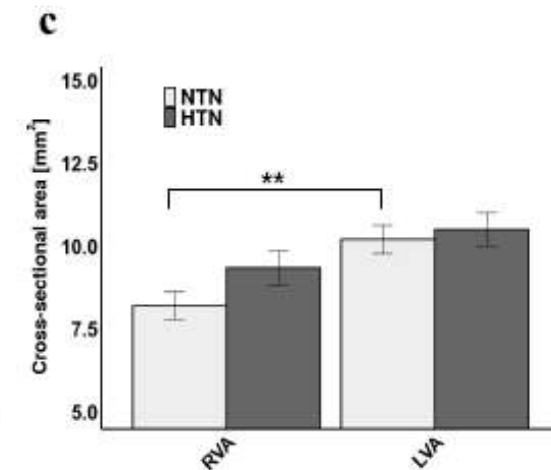

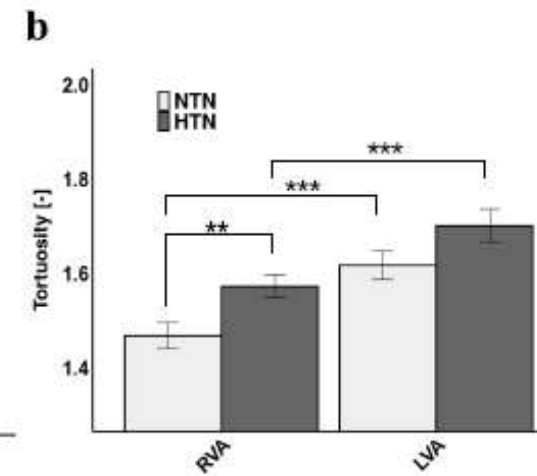

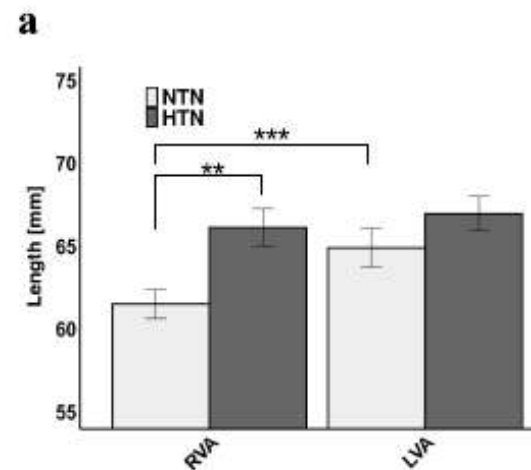

- R (R Core Team 2013)
- Shapiro-Wilk test for normality check
- Unpaired t-test to compare means (paired to compare right/left sides)
- Wilcoxon test for not normally distributed variables
- CI = 95%, * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

RESULTS

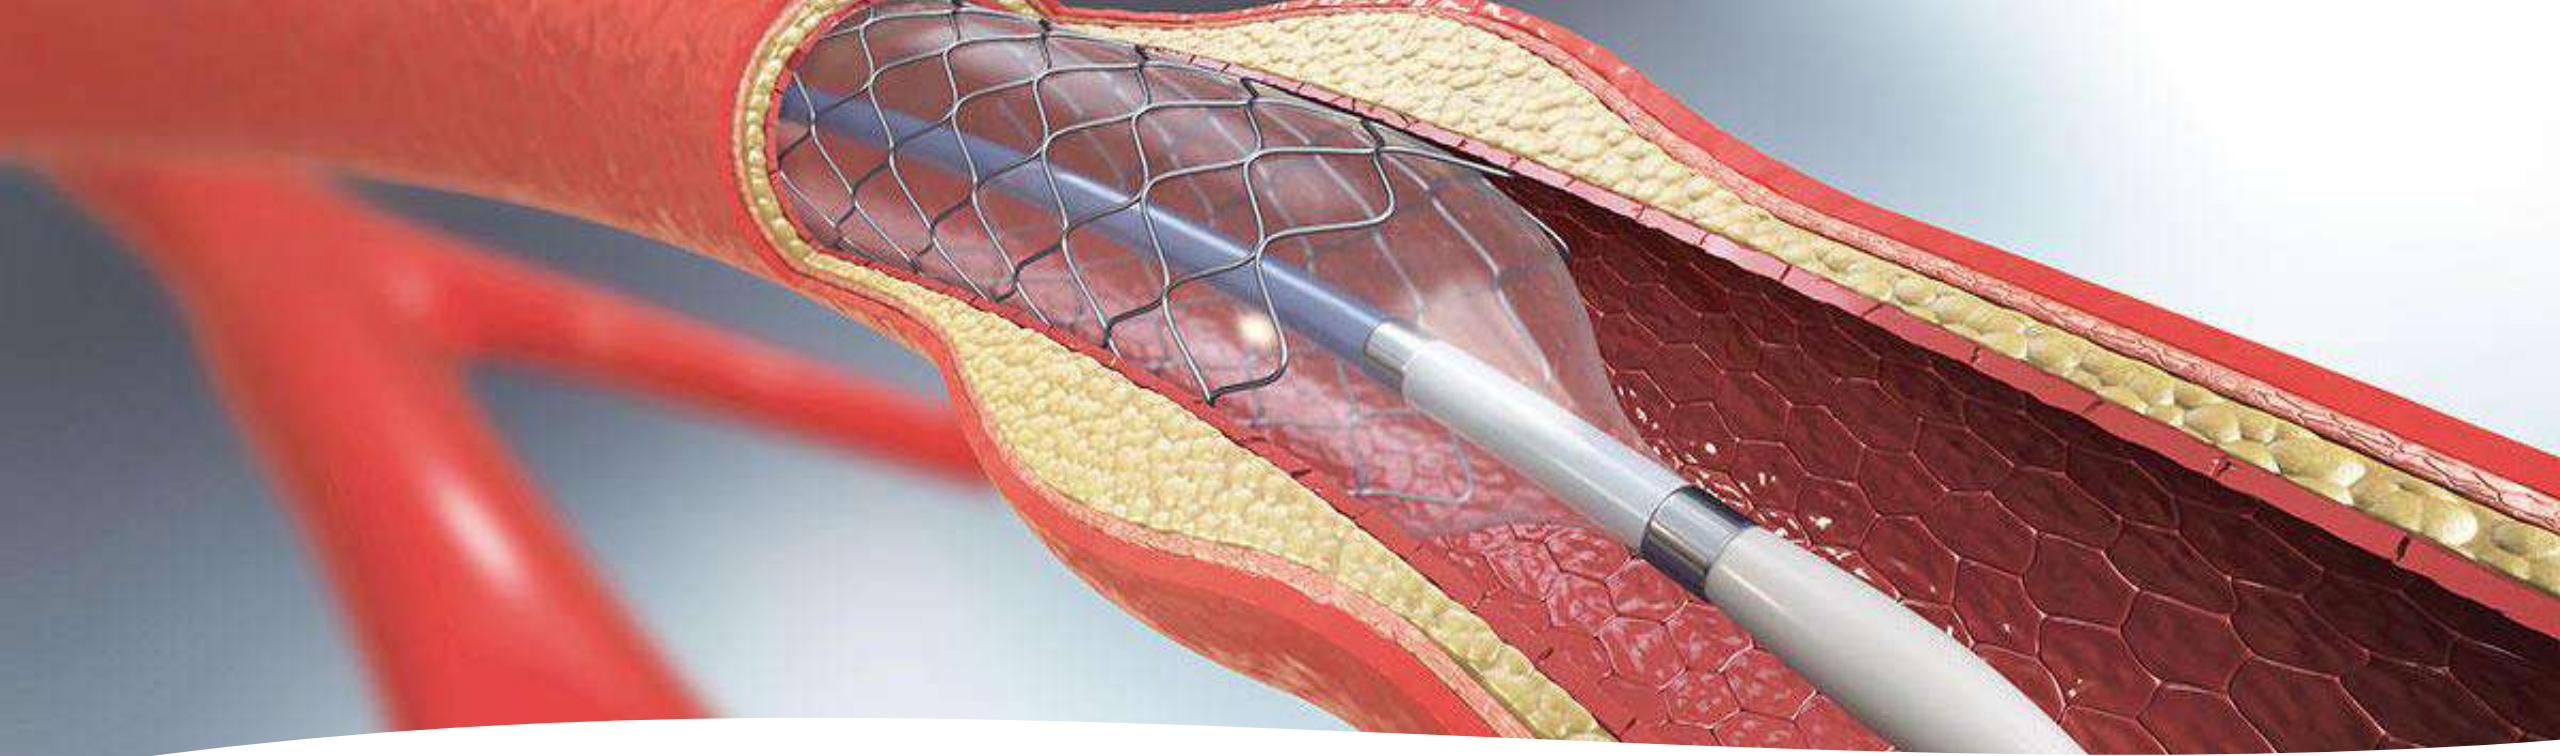

- In hypertensives, **flow was lower** in RCA, LCA, RVA but not in LVA
- Global and local **morphometry of carotid arteries did not differ** between hypertensives and normotensives
- Carotid flow did not correlate with morphometric features

- Hypertensives had **longer and more tortuous RVA**, but similar LVA
- Vertebral flow was negatively associated with length and cross-sectional area, but not with tortuosity

RCA=RIGHT CAROTID; **LCA**=LEFT CAROTID; **RVA**= RIGHT VERTEBRAL; **LVA**=LEFT VERTEBRAL; **BA**=BASILAR ARTERY

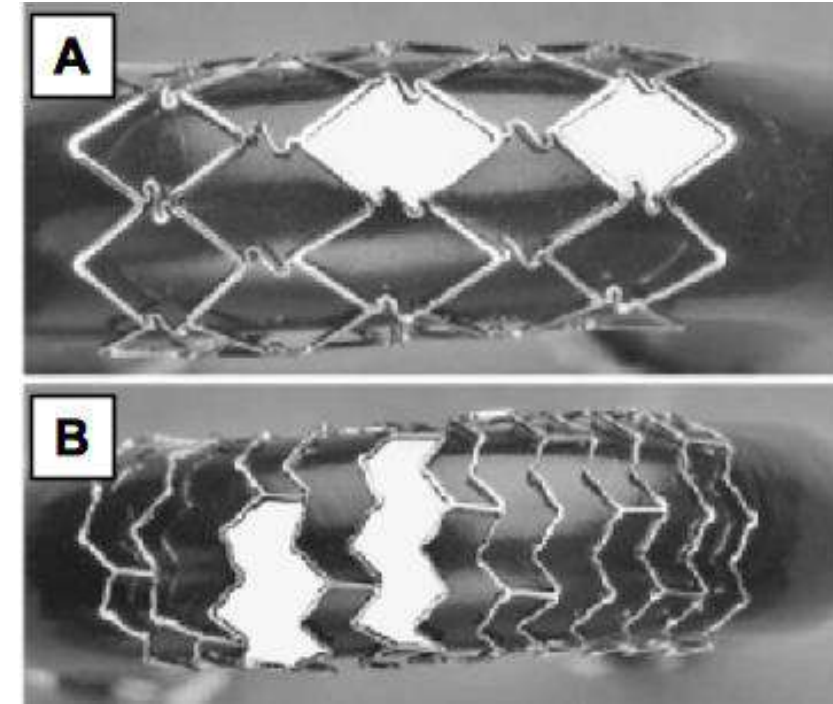

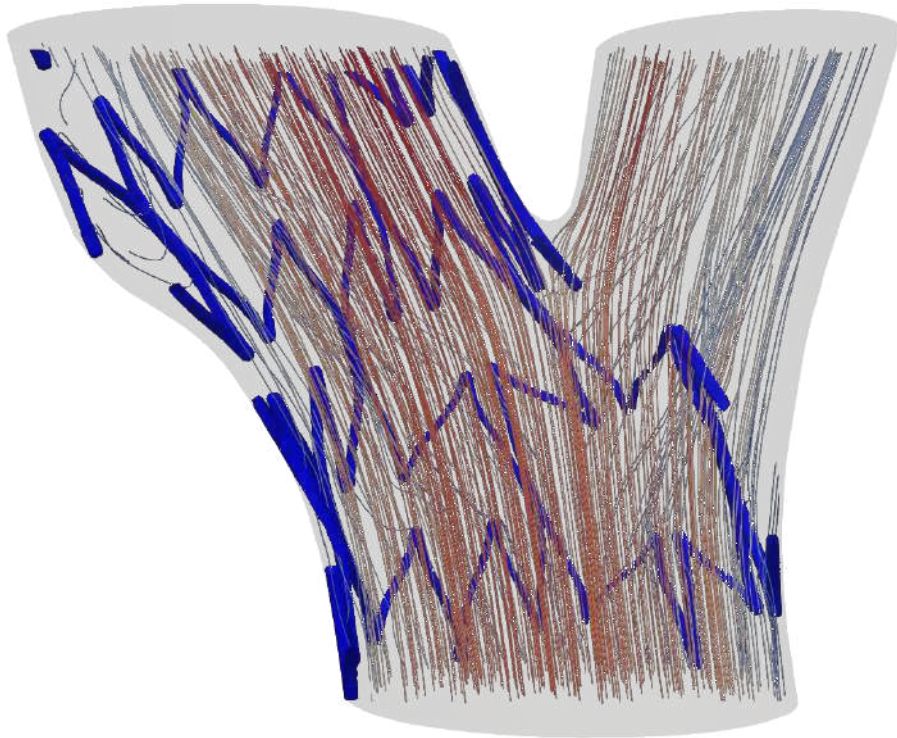

Carotid stenting, hemodynamics and restenosis

Why hemodynamics after stenting?

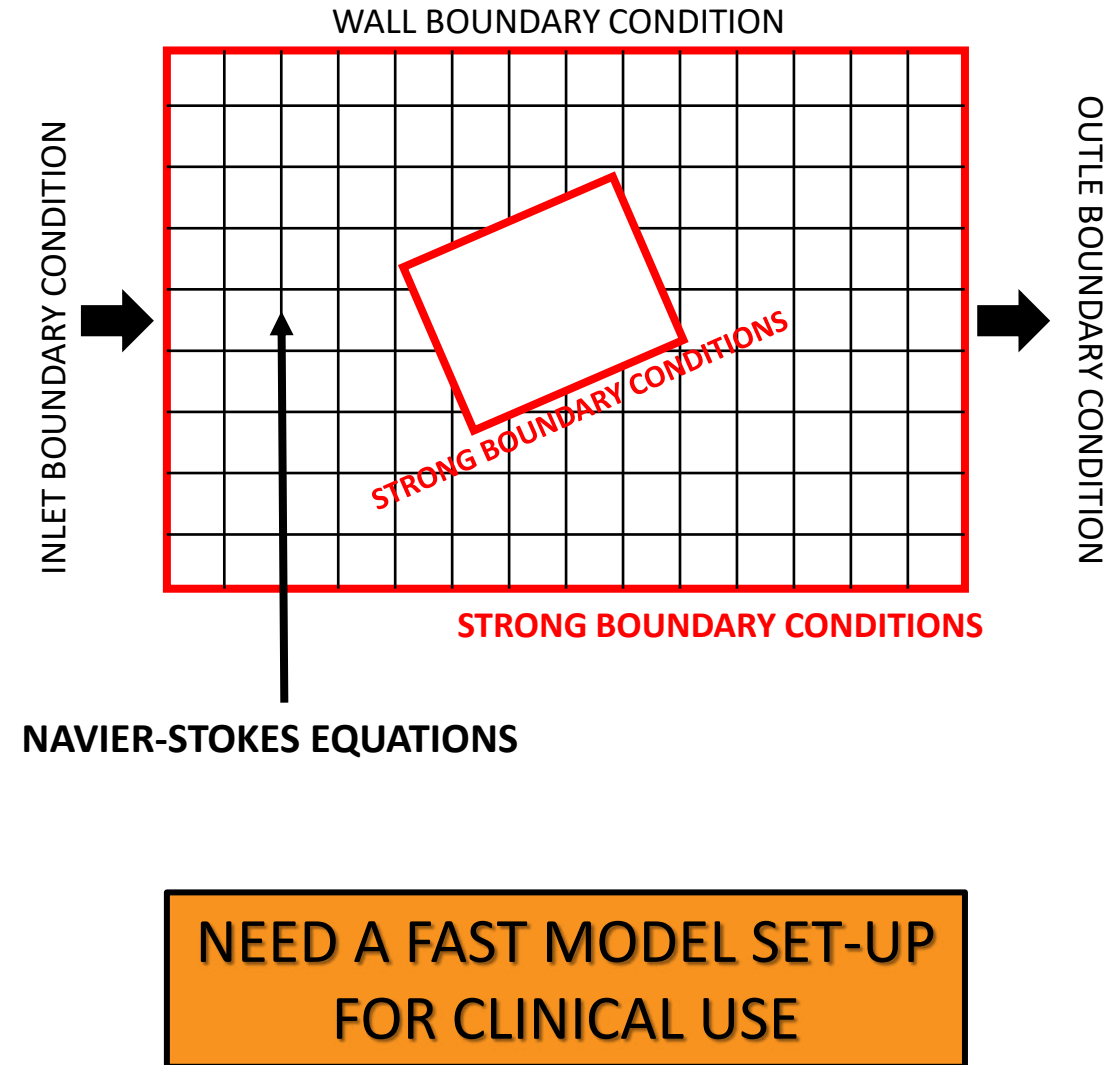

- Stent implant leads to in-stent restenosis (ISR) through endothelial damage (*Koskinas et al. 2012*)
- Stent design influences flexibility, plaque coverage and flow (*McClellan et al. 2002*)

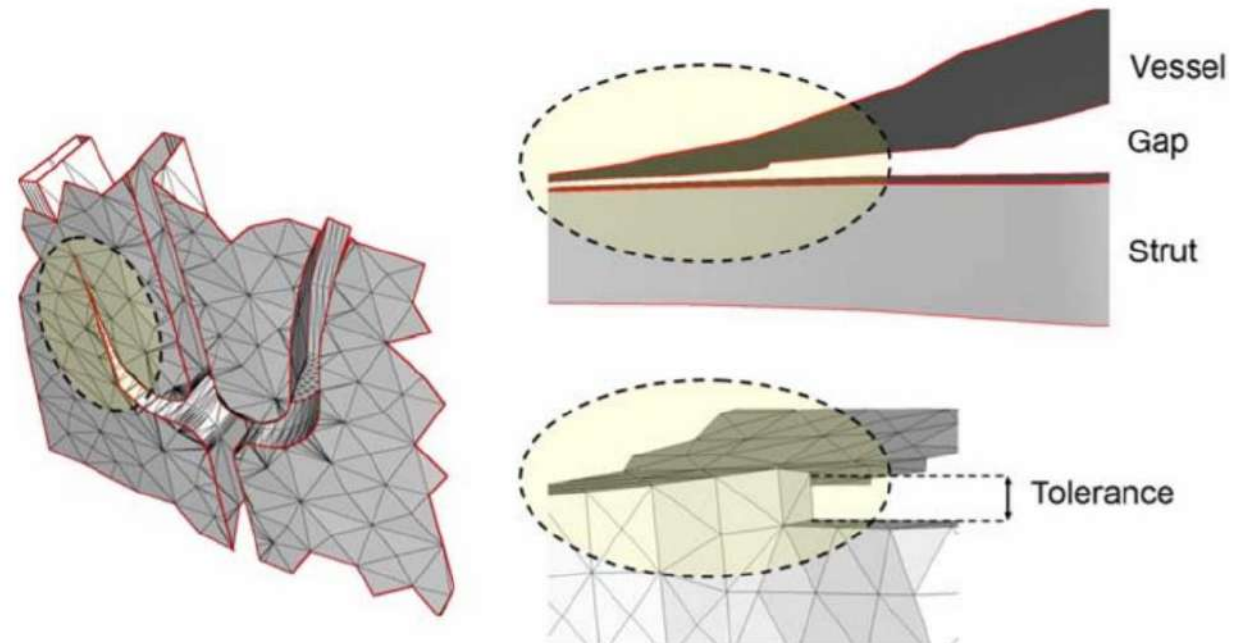

Why CFD?

- Superior spatio-temporal resolution than medical imaging/experimental techniques
- Predict flow in realistic/patient-specific models

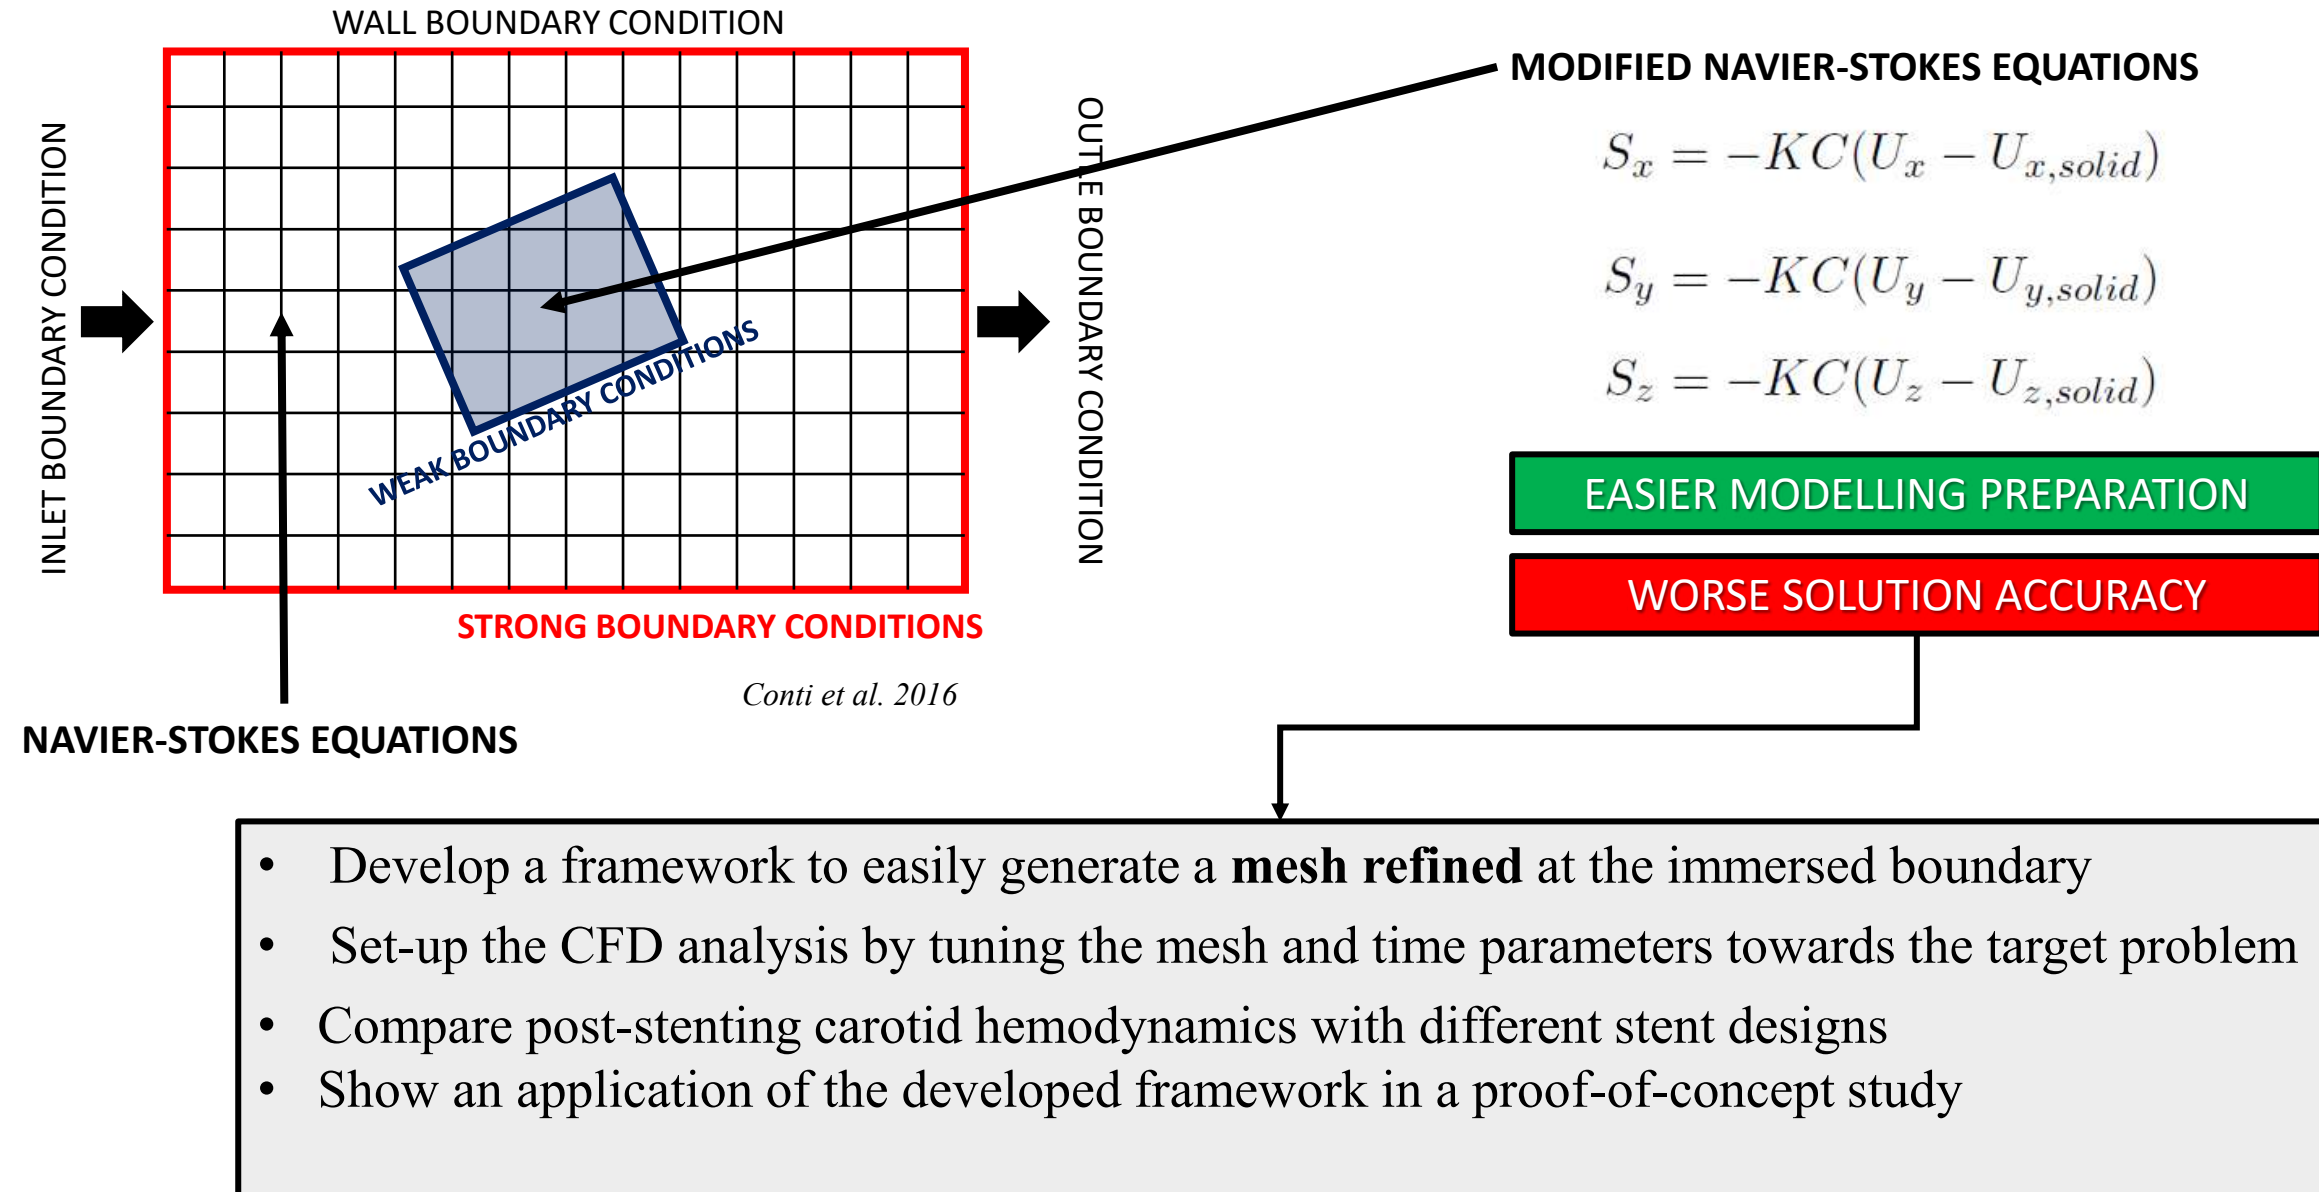

BACKGROUND

- X** Generation of computational grid by boolean operation is difficult due to thinness of stent struts
- X** Time-consuming model preparation

MESH CALIBRATION: IDEALIZED MODEL

- Idealized model of stent strut immersed in a cylindrical artery
- Assess two mesh sizes: refined and unrefined regions
- Comparison between body-fitted and immersed meshes

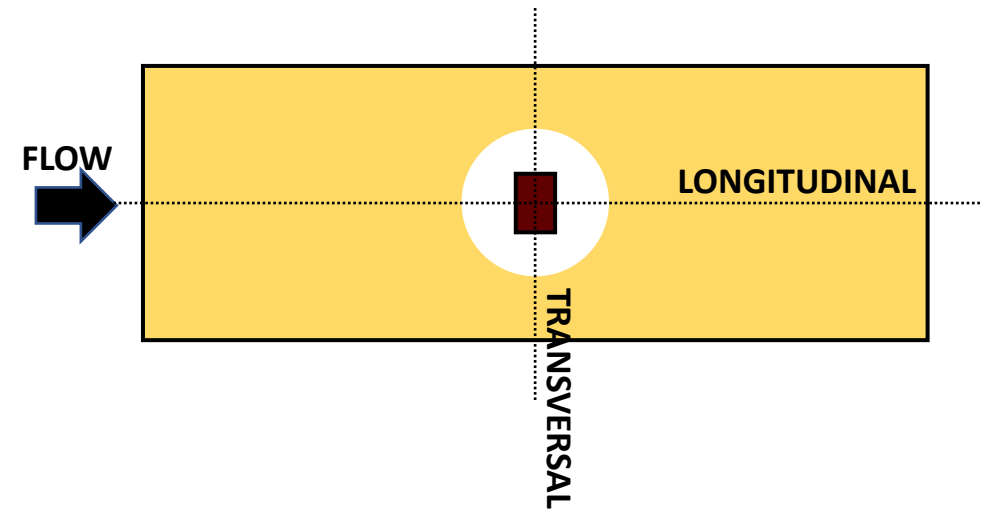

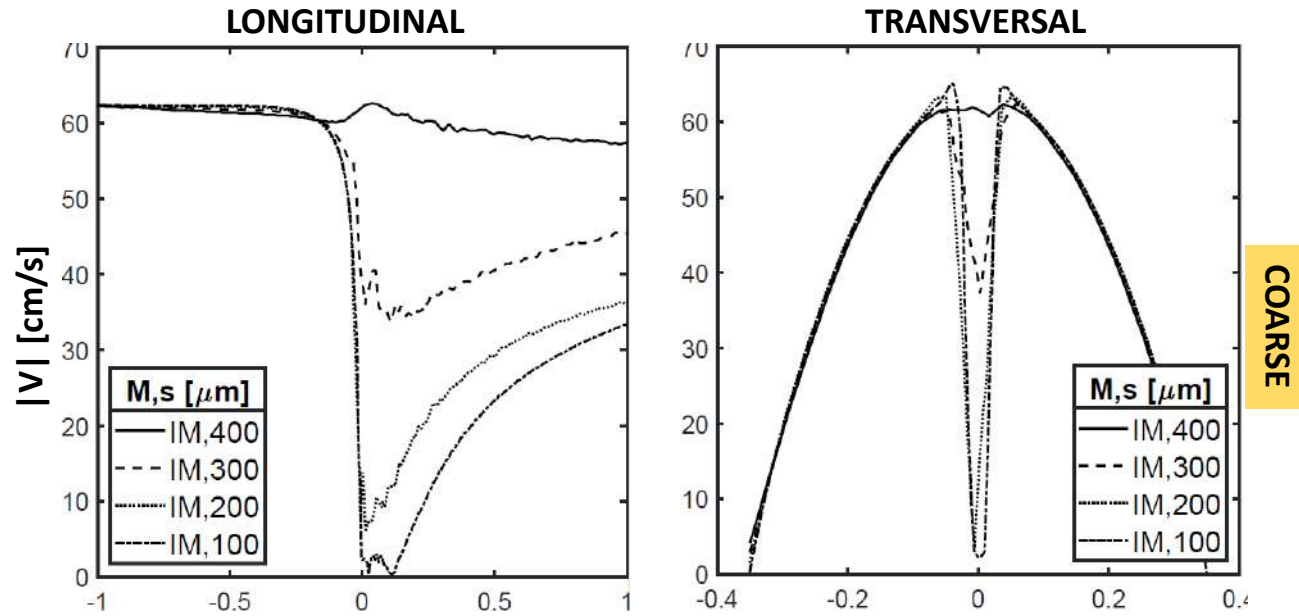

COARSE REGION

Edge length [μm]	Body-fitted [#DOF]	Immersed [#DOF]
400	19798	19448
300	44865	44756
200	146302	146258
100	1131822	1145806

REFINED REGION

Edge length [μm]	Body-fitted [#DOF]	Immersed [#DOF]
50	201663	191392
25	472629	418570
18.75	687250	576709
12.5	1164805	892674

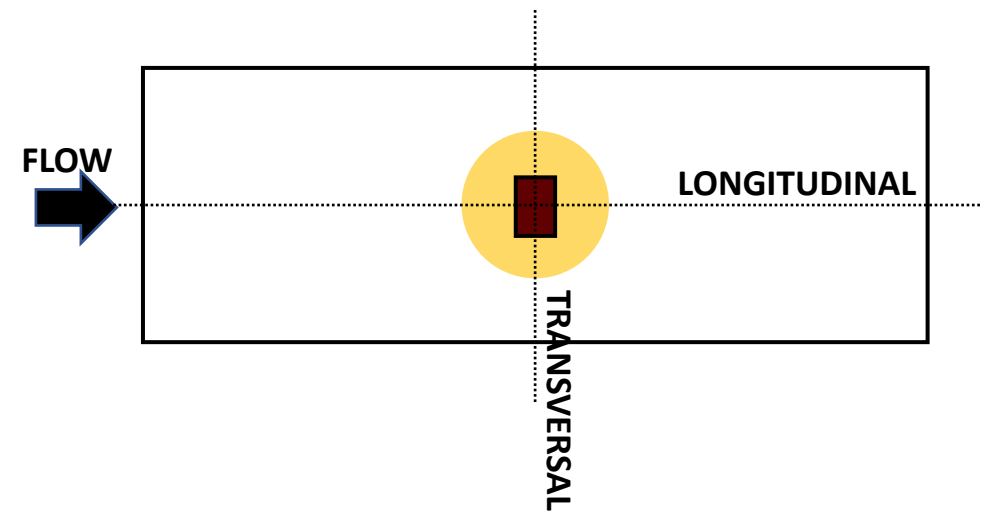

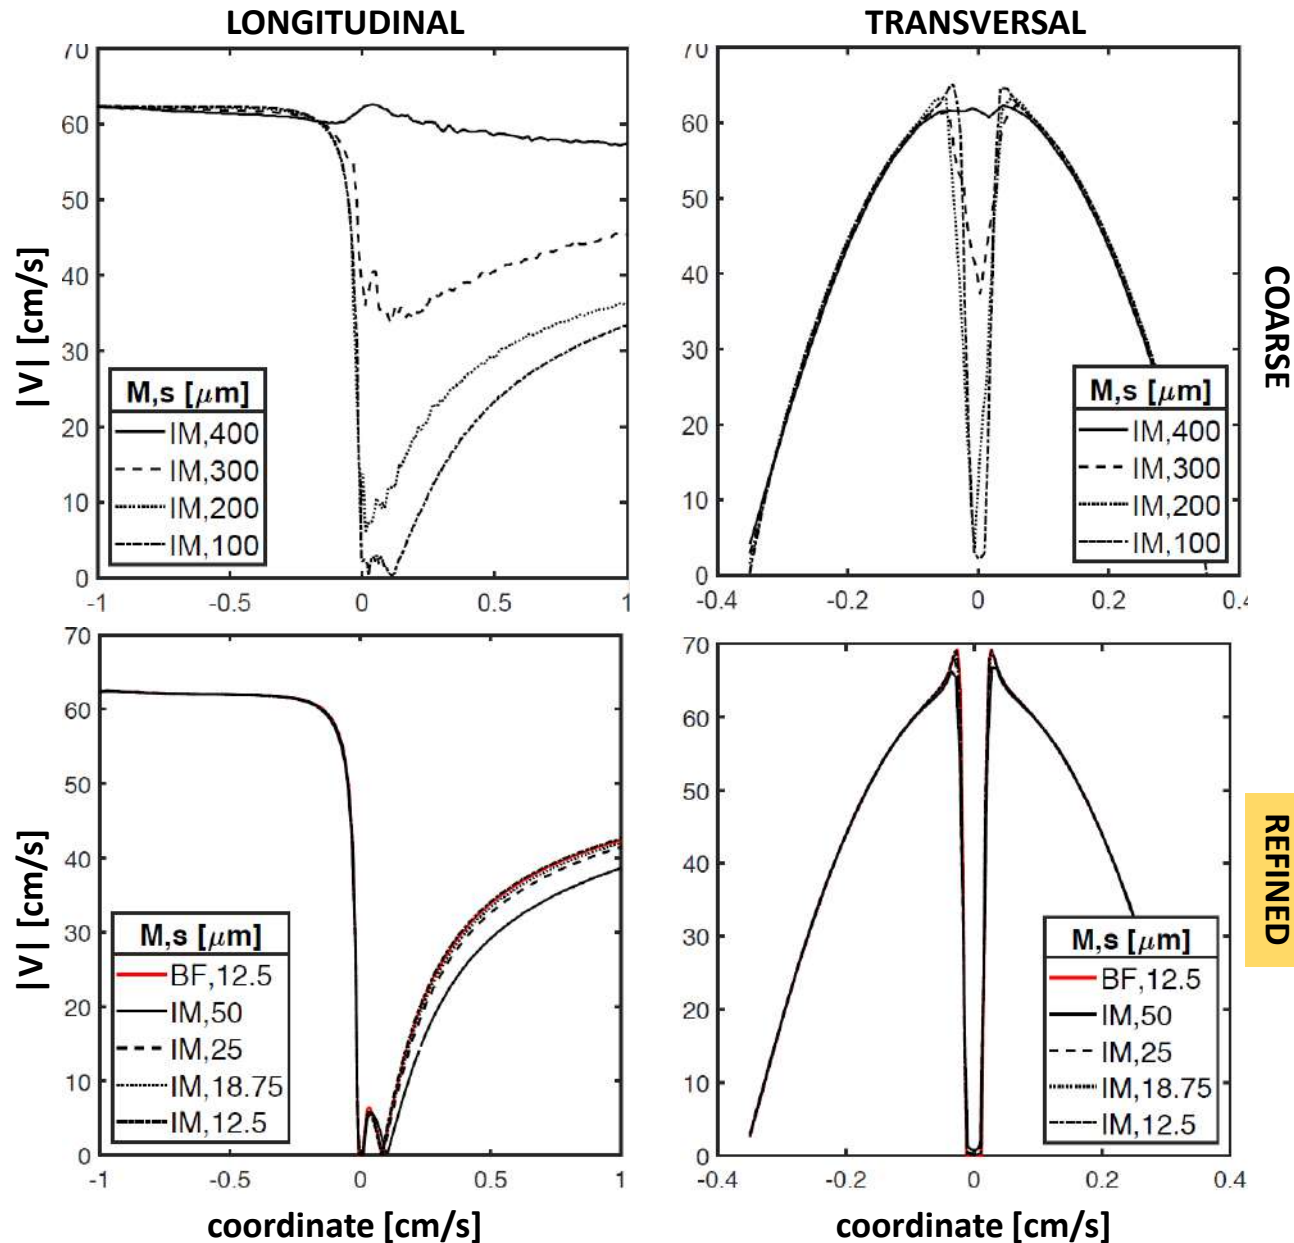

MESH CALIBRATION: VELOCITY RESULTS

RESULTS

- Element size of 300 μm in the **unrefined** region

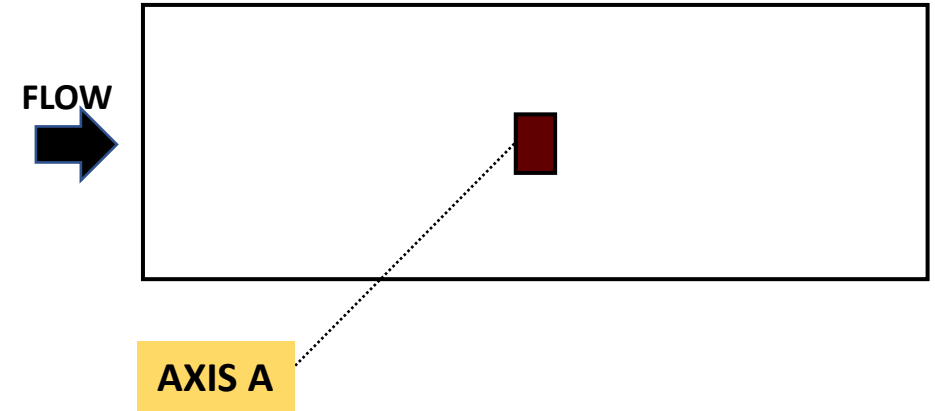

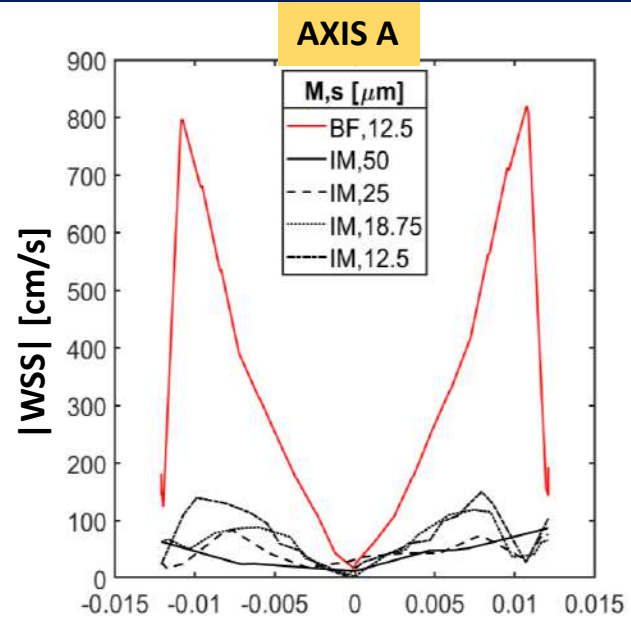

MESH CALIBRATION: VELOCITY RESULTS

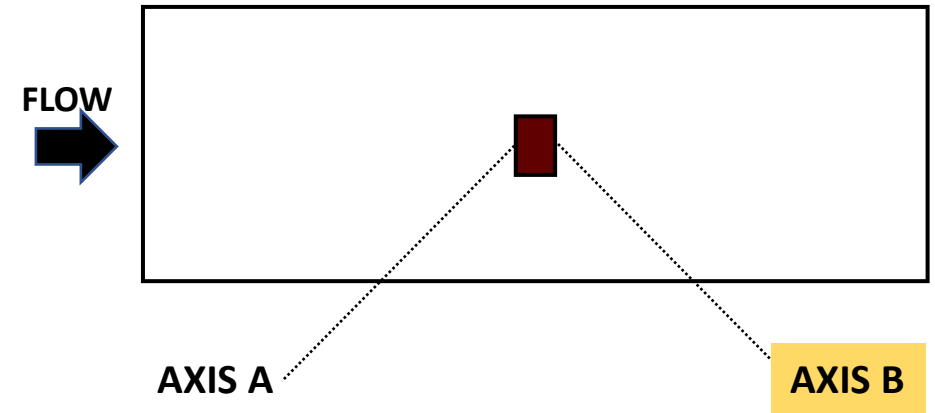

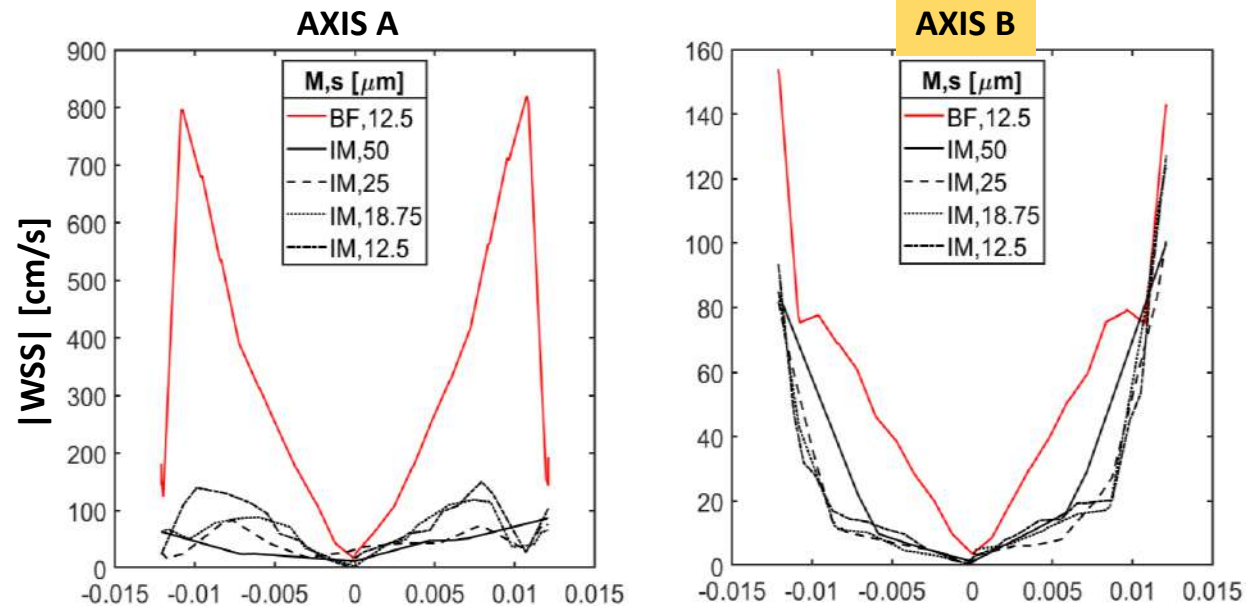

RESULTS

- Element size of 300 μm in the **unrefined** region
- Element size 25 μm in the **refined** region
- Growth rate of 1.2 in the **transition** zone

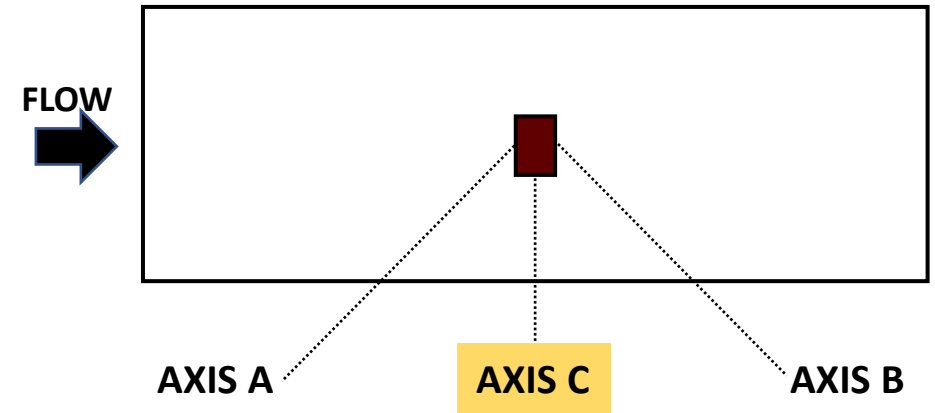

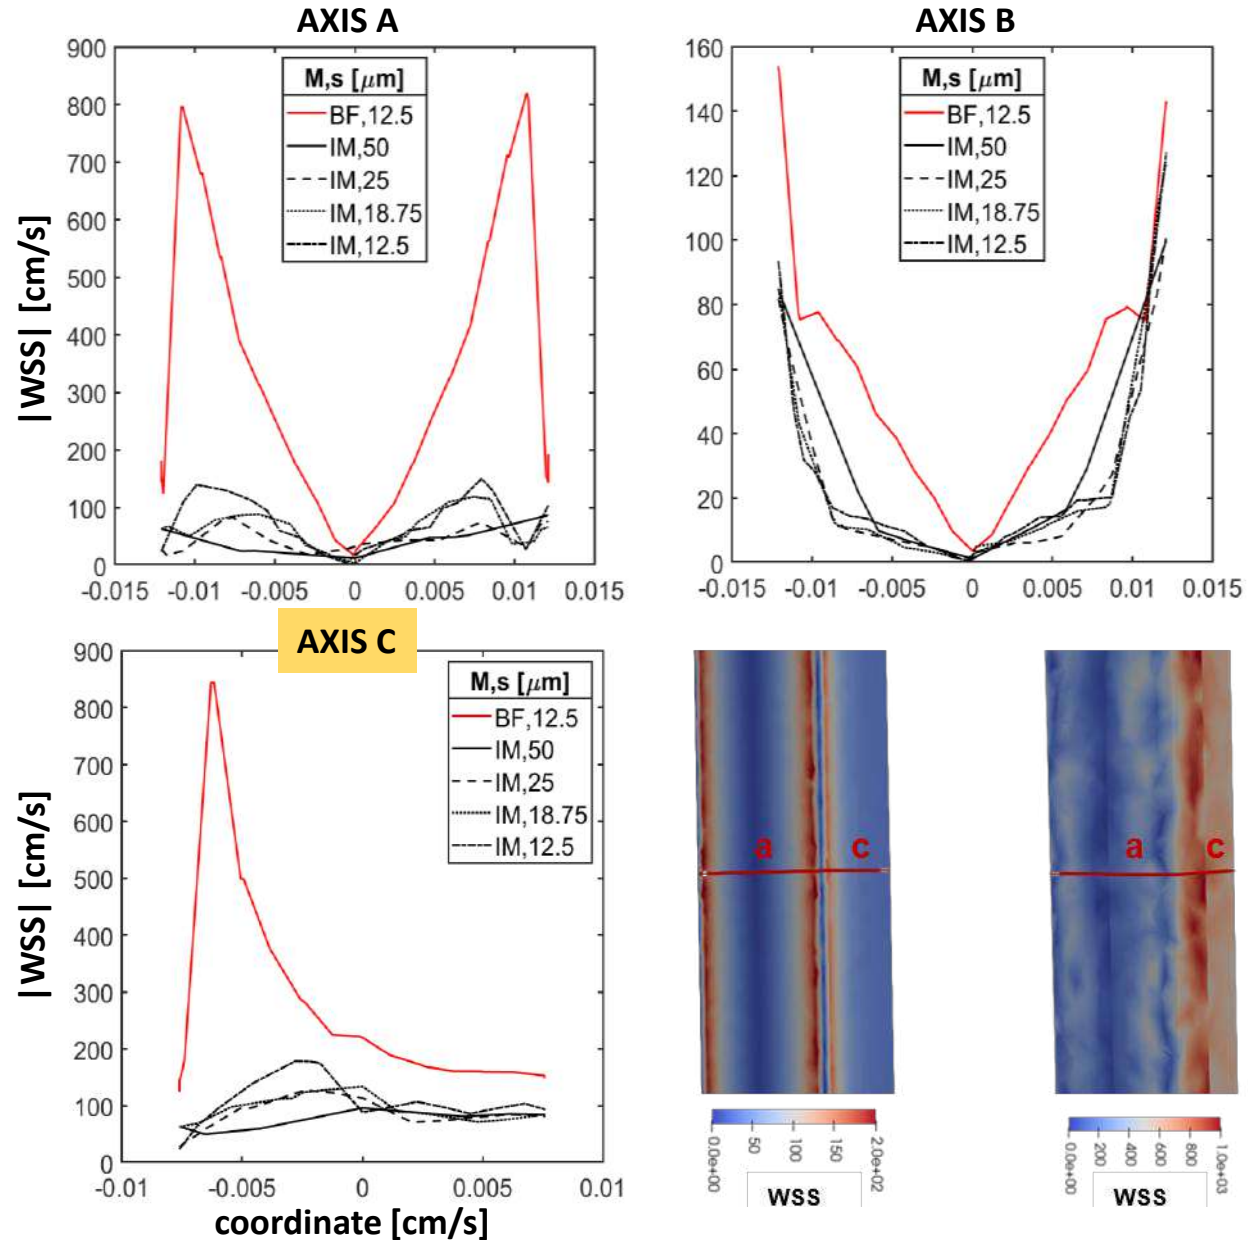

MESH CALIBRATION: WSS RESULTS

MESH CALIBRATION: WSS RESULTS

MESH CALIBRATION: WSS RESULTS

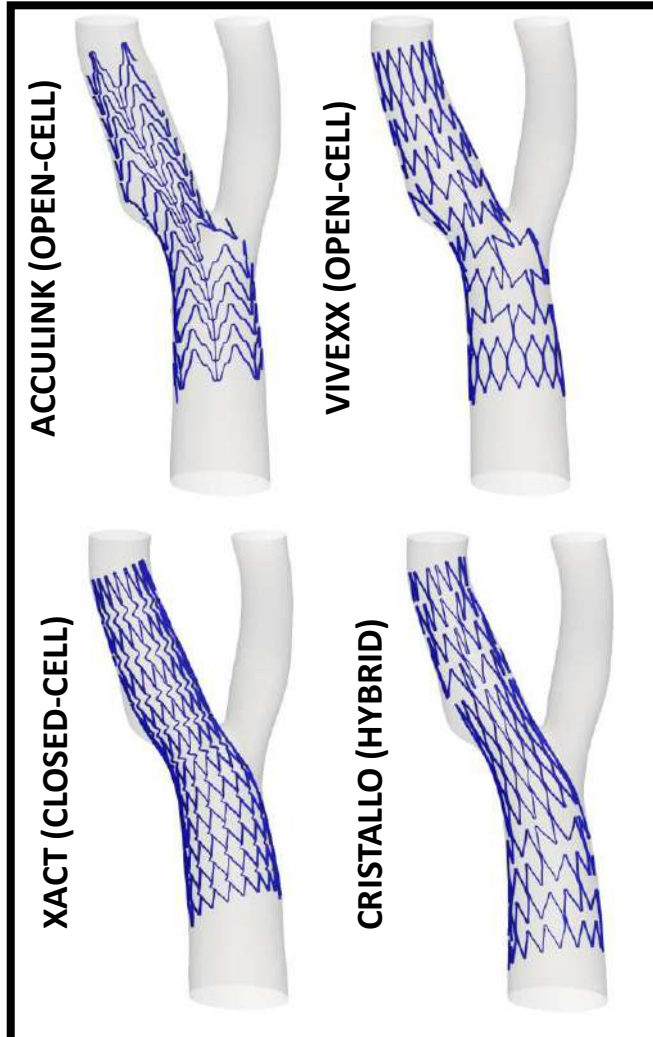

RESULTS

- WALL SHEAR STRESS (WSS) are less accurate
- No improvement with mesh size

POST-STENTING BLOOD FLOW: COMPARATIVE STUDY

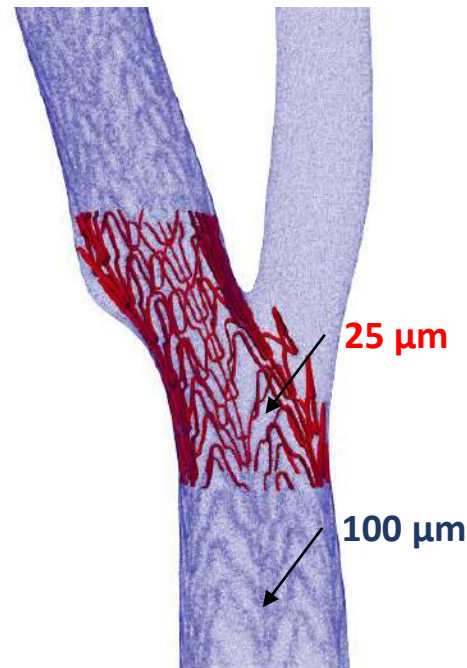

POST-STENTING CAROTID AND STENT GEOMETRIES

MESH GENERATION WITH LOCAL REFINEMENT

Element size

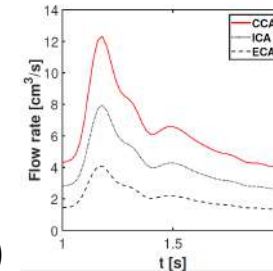

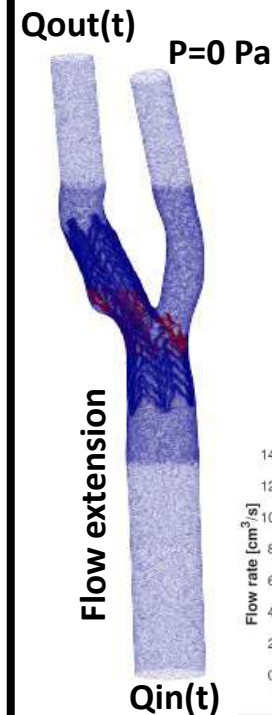

- **100 μm** in the stented region
- **25 μm** in a stent subregion at bifurcation

CFD SET-UP

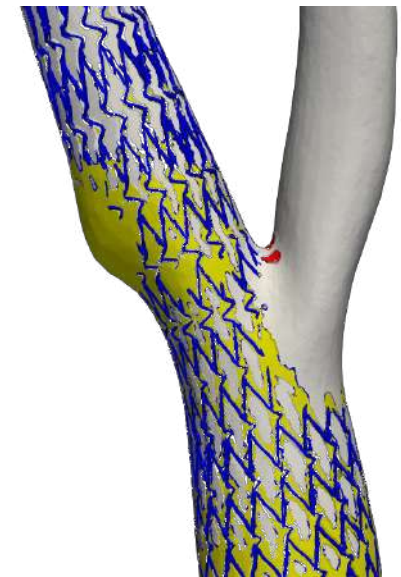

Modelling assumptions

- Flow split ICA/ECA
- Zero traction outlet
- Laminar
- Newtonian blood

POST-PROCESSING THROUGH HEMODYNAMIC INDECES

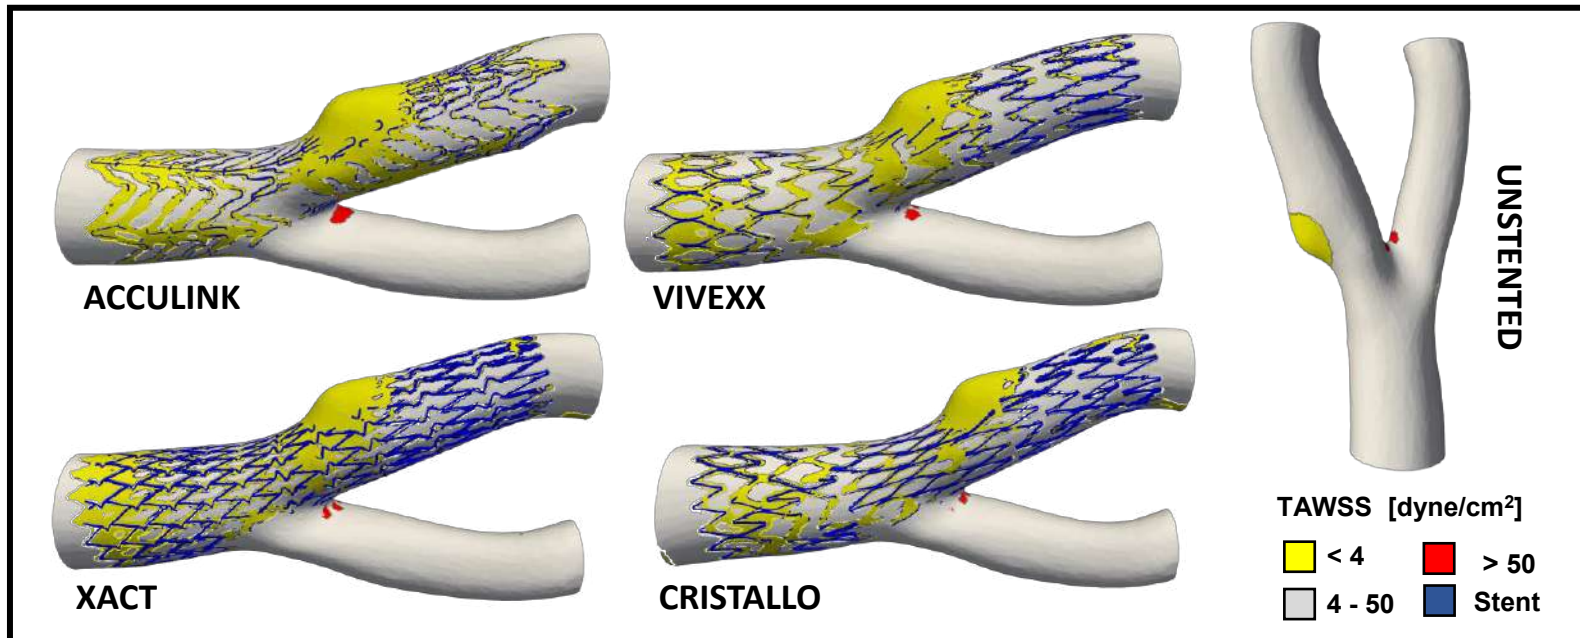

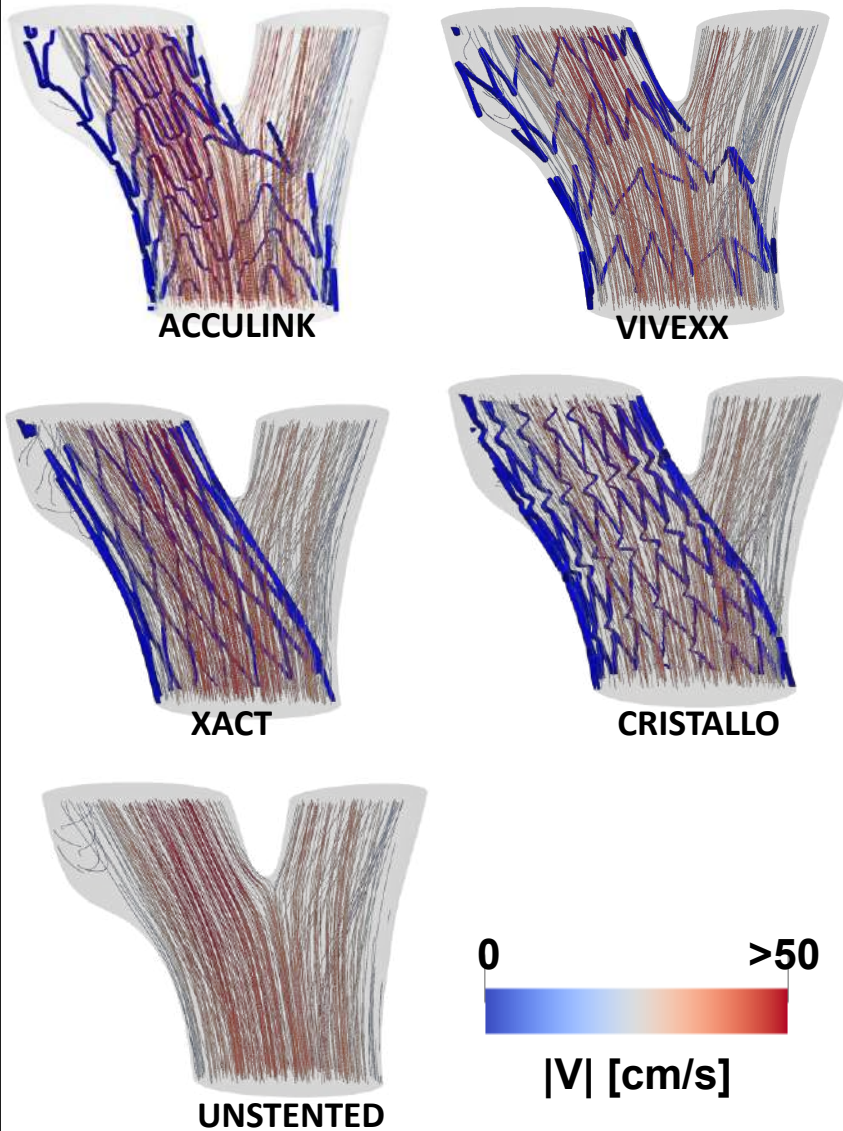

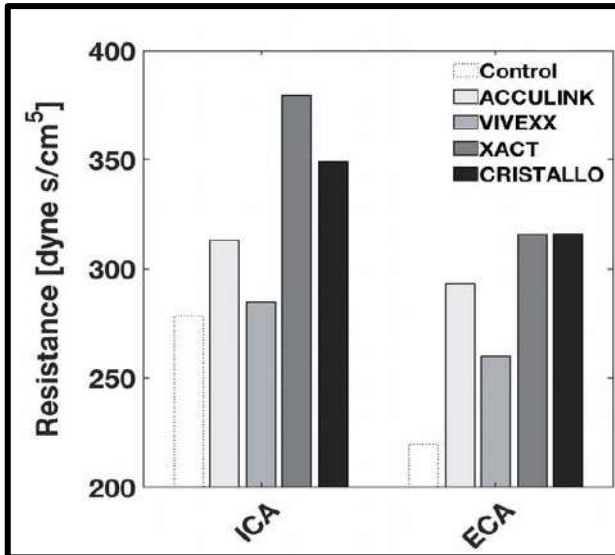

- **Velocity streamline**
- **Time Averaged Wall Shear Stress**
< 4 dyne/cm² → ISR
- **Vascular resistance:**
 $R_{ICA} = (P_{CCA} - P_{ICA}) / (Q_{ICA})$
 $R_{ECA} = (P_{CCA} - P_{ECA}) / (Q_{ECA})$

RESULTS

RESULTS

- No significant alteration of flow pattern around thin stent struts
- Increased low TAWSS area
- Increased ECA resistance (closed-cell)

CONCLUSIONS AND FUTURE PERSPECTIVES

- Implemented computational frameworks to investigate geometrical and hemodynamic aspects of carotid artery
- Applied the morphometric framework in a multi-patient study to automatically extract morphometric measures
- Applied the hemodynamic framework in a proof-of-concept study comparing different stent designs

- ➔ Increase automatization of morphometric framework (segmentation, splitting)
- ➔ Improve WSS accuracy of hemodynamic framework (forcing parameter)
- ➔ Validate hemodynamic framework (numerically/experimentally)
- ➔ Apply hemodynamic framework on a multi-patient study
